High Quality 8-bit PAL/NTSC Video Encoder with six DAC outputs

Preliminary Technical Data

ADV7190

FEATURES

6 high Quality 10-Bit Video DACs

ITU-R BT601/656 YCrCb to PAL/NTSC Video Encoder
NTSC-M, PAL-M/N, PAL-B/D/G/H/I, PAL-60

Video Input supports:
- **CCIR-656 4:2:2 8-Bit and 16-Bit Parallel Input Format**
- **SMPTE 170M NTSC Compatible Composite Video**
- **ITU-R BT.470 PAL Compatible Composite Video**

Video Output:
- **YUV Betacam, MII & SMPTE Output levels**
- **Multi-standard video output support:**
- **Composite (CVBS)**
- **Component S-Video (Y/C)**
- **Componet YUV & EuroSCART RGB**

Clocking:
- **Single 27MHz Clock required**
- **4xOversampling with internal 54 MHz PLL**
- **Square Pixel Operation**

Advanced Power Management

Video control features:
- **Digital Noise Reduction**
- **Color and Luma Scaling**
- **Programmable pedestal level**
- **Hue, Brightness, Contrast and Saturation**
- **Average Brightness detection**
- **Programmable Clamping Output signal**
- **Programmable VBI (Vertical Blanking Interval)**
- **Programmable Sub-Carrier Frequency and Phase.**
- **Programmable LUMA Delay**
- **Programmable CHROMA Delay**
- **Programmable Gamma Correction**
- **Field Counter**
- **Multiple Programmable Luma Filters & Chroma Filters**
- **SSAF™on Luma channel(Super Sub-Alias Filter)**

Interlaced/Non Interlaced Operation
Complete on-chip Video Timing Generator
Programmable Multi-Mode Master/Slave Operation

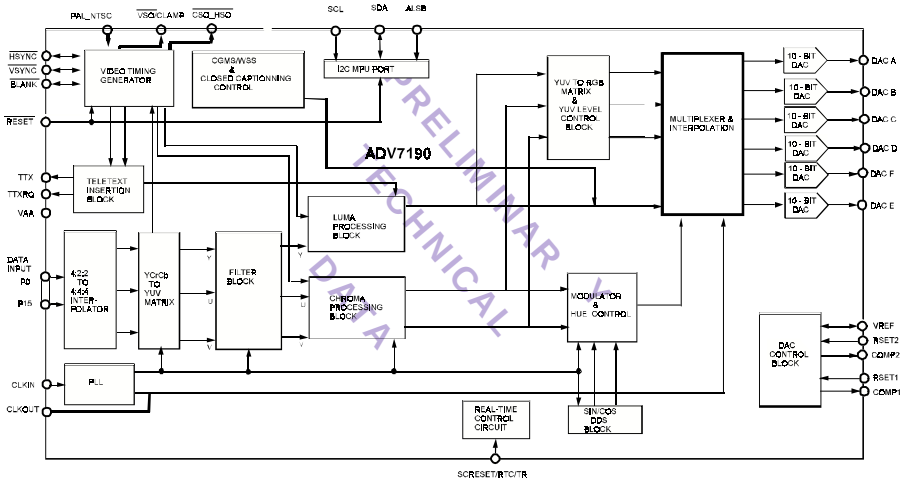
Macrovision Anti-Taping Rev 7
CGMS (Copy Generation Management System)
WSS (Wide Screen Signalling)
Close Captioning support.
Teletext Insertion Port (PAL-WST)

2 Wire Serial MPU Interface (I^2C Compatible & Fast I^2C)

Supply Voltage 5V & 3.3V Operation
64-Pin LQFP Package

APPLICATIONS
High Performance DVD Playback Systems,
PC Video/Multimedia
Digital Satellite/Cable Systems (Set top boxes/IRD)

BLOCK DIAGRAM



* This device is protected by U.S. patent numbers 4631603, 4577216 and 4819098 and other intellectual property rights.
The Macrovision anticopy process is licensed for non-commercial home use only, which is its sole intended use in the device. Please contact sales office for latest Macrovision version available.
ITU-R and CCIR are used interchangeably in this document (ITU-R has replaced CCIR recommendations.

5V SPECIFICATIONS

(V_{AA} = + 5V ± 5%, V_{REF} = 1.235 V, $R_{SET1,2}$ =1k2 Ω unless otherwise noted. All specifications T_{MIN} to T_{MAX}[1] unless otherwise noted)

Parameter	Min	Typ	Max	Units	Test Conditions[2]
STATIC PERFORMANCE					
Resolution (each DAC)			10	Bits	
Accuracy (each DAC)					
Integral Nonlinearity[3]			±1.0	LSB	
Differential Nonlinearity[3]			±1.0	LSB	Guaranteed monotonic
DIGITAL INPUTS					
Input High Voltage, V_{INH}	2			V	
Input Low Voltage, V_{INL}			0.8	V	
Input Current, I_{IN}			±1	μA	V_{IN} = 0.4 V or 2.4 V
Input Capacitance, C_{IN}		10		pF	
DIGITAL OUTPUTS					
Output High Voltage, V_{OH}	2.4			V	I_{SOURCE} = 400 μA
Output Low Voltage, V_{OL}			0.4	V	I_{SINK} = 3.2 mA
Tri-State Leakage Current			10	μA	
Tri-State Output Capacitance		10		pF	
ANALOG OUTPUTS					
Output Current		4.33		mA	R_L = 1200Ω
DAC to DAC Matching[4]		1.0	4.0	%	
Output Compliance, V_{OC}	0		+1.4	V	
Output Impedance, R_{OUT}		30		KΩ	
Output Capacitance, C_{OUT}			30	pF	I_{OUT} = 0 mA
VOLTAGE REFERENCE					
Reference Range, V_{REF}	1.112	1.235	1.359	V	$I_{VREFOUT}$ = 20 μA
POWER REQUIREMENTS					
V_{AA}	4.75	5.0	5.25	V	
Normal Power Mode					
I_{DAC}(max)[5]		30		mA	
I_{CCT} (2xOversampling)[6]		100		mA	
I_{CCT} (4xOversampling)[6]		120		mA	
I_{PLL}				mA	
Sleep Mode					
I_{DAC}		0.1		μA	
I_{CCT}		0.1		μA	
Power Supply Rejection Ratio		0.01	0.5	% / %	COMP = 0.1μF

NOTES

1 Temperature range T_{MIN} to T_{MAX} : 0°C to +70°C.
2 The max/min specifications are guaranteed over this range. The max/min values are typically over 4.75V to 5.25V
3 Characterized by design
4 Guaranteed by characterization.
5 All six DACs on.
6 I_{CCT} or the circuit current, is the continuous current required to drive the device.

Specifications subject to change without notice.

3.3V SPECIFICATIONS

(V_{AA} = + 3.0V - 3.6V, V_{REF} = 1.235 V, $R_{SET1,2}$ =1k2 Ω unless otherwise noted. All specifications T_{MIN} to T_{MAX} [1] unless otherwise noted)

ABSOLUTE MAXIMUM RATINGS *

V_{AA} to GND.....7V
Voltage on any Digital Input Pin.....GND-0.5V to V_{AA}+0.5V
Storage Temperature (T_S).....-65°C to +150°C
Junction Temperature(T_J).....+150°C
Lead Temperature (Soldering, 10 secs).....+260°C
Analog Outputs to GND[1].....GND -0.5 to V_{AA}

NOTES
*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
[1]Analog Output Short Circuit to any Power Supply or Common can be of an indefinite duration.

ORDERING GUIDE

Model	Temperature Range	Package Option
ADV7190KST	0°C to 70°C	LQFP

PACKAGE THERMAL PERFORMANCE

The 64pin package is used for this device. The junction-to-ambient (θ_{J-A}) thermal resistance in still air on a four layer PCB is 44°C/W. The junction-to-case thermal resistance (θ_{J-C}) is 24.6° C.

To reduce power consumption when using this part the user can run the part on a 3.3V supply, turn off any unused DACs.

The user must at all times stay below the maximum junction temperature of 110°C. The following equation shows how to calculate this junction temperature:

Junction Temperature =
$[V_{AA} \times (I_{DAC} + I_{CCT})] \times \theta_{J-A} + 70^{O}C$

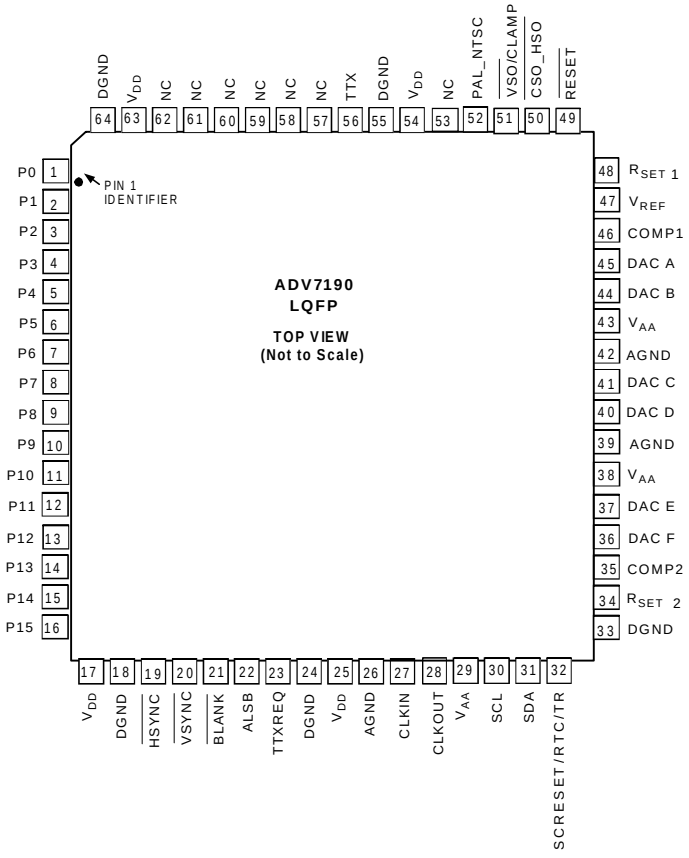
I_{DAC} = 10 mA + (sum of the average currents consumed by each powered-on DAC)

Average current consumed by each powered-on DAC =

$(V_{REF} \times K) / R_{SET}$

V_{REF} = 1.235V
K = 4.2146

PIN CONFIGURATION



PIN DESCRIPTION

Mnemonic	Input/Output	Function
AGND	G	Analog Ground
ALSB	I	TTL Address Input. This signal sets up the LSB of the MPU address.
$\overline{\text{BLANK}}$	I/O	Video Blanking Control Signal. This signal is optional.See page27.
CLKIN	I	TTL Clock Input. Requires a stable 27MHz reference clock for standard operation. Alternatively a 24.52MHz (NTSC) or 29.5MHz (PAL) can be used for square pixel operation.
CLKOUT	O	Clock Output Pin providing 54MHz output from the internal PLL.
COMP 1	O	Compensation Pin for DACs A, B and C. Connect a 0. lμF Capacitor from COMP to V_{AA} .
COMP 2	O	Compensation Pin for DACs D, E and F. Connect a 0. lμF Capacitor from COMP to V_{AA}.
$\overline{\text{CSO\_HSO}}$	O	Dual function $\overline{\text{CSO}}$ or $\overline{\text{HSO}}$ Output sync signal at TTL level.
DAC A	O	Composite / Y / GREEN AnalogOutput. This DAC is capable of providing 4.33mA output.
DAC B	O	S-Video Y / U / BLUE Analog Output. This DAC is capable of providing 4.33mA output.
DAC C	O	S-Video C / V / RED Analog Output.This DAC is capable of providing 4.33mA output.
DAC D	O	Composite / Y / GREEN Analog Output. This DAC is capable of providing 4.33mA output.
DAC E	O	S-Video Y / U / BLUE Analog Output. This DAC is capable of providing 4.33mA output.
DAC F	O	S-Video C / V / RED Analog Output.This DAC is capable of providing 4.33mA output
DGND	G	Digital Ground
$\overline{\text{HSYNC}}$	I/O	HSYNC (Modes 1, 2 and 3) Control Signal. This pin may be configured to be an output (Master Mode) or an input (Slave Mode) and accept Sync signals.
P0-P15	I	8-Bit or 16-Bit 4:2:2 Multiplexed YCrCb Pixel Port .The LSB of the incoming data is set up on P0.
PAL_NTSC	I	Input signal to select PAL or NTSC mode of operation, pin set to Logic 1 selects PAL.
SCRRESET/RTC/TR	I	Multifunctional Input: Real Time Control(RTC) input, Timing Reset input, Subcarrier Reset input.

$\overline{\text{RESET}}$	I	The input resets the on-chip timing generator and sets the ADV7190 into default mode. See Appendix 8 for Default Register settings.
R_{SET1}	I	A 1200 Ohm resistor connected from this pin to ground is used to control full-scale amplitudes of the Video Signals from the DACs .
R_{SET2}	I	A 1200 Ohm resistor connected from this pin to ground is used to control full-scale amplitudes of the Video Signals from the DACs .
SCL	I	MPU Port Serial Interface Clock Input.
SDA	I/O	MPU Port Serial Data Input/Output.
TTX	I	Teletext Data Input Pin
TTXREQ	O	Teletext Data Request Output Signal, used to control teletext data transfer.
V_{AA}	P	Analog Power Supply (+3 V to + 5 V).
V_{DD}	P	Digital Power Supply (+3 V to + 5 V).
V_{REF}	I/O	Voltage Reference Input for DACs or Voltage Reference Output (1.235V). When using an external Vref, subaddress register 36_h, bit 4 must be set to '1'. Also, whenever writing to this bit, the PLL must be reset (MR61)
$\overline{\text{VSO}}$/CLAMP	O	$\overline{\text{VSO}}$ TTL Output Sync Signal. TTL Output Signal to external circuitry to enable clamping of all video signals.
$\overline{\text{VSYNC}}$	I/O	$\overline{\text{VSYNC}}$ Control signal. This pin may be configured as an output (Master Mode) or as an input (Slave Mode) and accept VSYNC as a control signal.

GENERAL DESCRIPTION

The ADV7190 is an integrated Digital Video Encoder that converts digital CCIR-601/656 4:2:2 8 bit (or 16-bit) component video data into a standard analog baseband television signal compatible with world wide standards.

There are six DACs available on the ADV7190 each of these DACs is capable of providing 4.33mA of current.In addition to the composite output signal there is the facility to output S-Video, RGB Video and YUV Video.
All YUV formats (SMPTE, MII and Betacam) are supported.

Digital Noise Reduction allows improved picture quality in removing high frequency, low amplitude noise.
Programmable gamma correction is also available, allowing the user to program two individual gamma curves.

The on-board SSAF™ (Super Sub-Alias Filter), with extended luminance frequency response and sharp stop-band attenuation enables studio quality video playback on modern TVs giving optimal horizontal line resolution. An additional sharpness control feature allows high frequency enhancement on the luminance signal.

The device is driven by a 27 MHz clock. Data can be input at 27MHz or 54 MHz (on-board PLL). The ADV7190 also supports both PAL and NTSC square pixel operation. In this case the encoder requires a 24.54 MHz Clock for NTSC or 29.5MHz Clock for PAL. All internal timing is generated on-chip.

An advanced power management circuit enables optimal control of power consumption in both normal operating modes and sleep modes.

The functional features or controls are described in detail on page 25-28.

The Output Video Frames are synchronised with the incoming data Timing Reference Codes. Optionally the Encoder accepts (and can generate) $\overline{\text{HSYNC}}$, $\overline{\text{VSYNC}}$ & FIELD timing signals. These timing signals can be adjusted to change pulse width and position while the part is in master mode.

$\overline{\text{HSO}}$/$\overline{\text{CSO}}$ and $\overline{\text{VSO}}$ TTL outputs are also available and are timed to the analog output video.

A separate teletext port enables the user to directly input teletext data during the vertical blanking interval.

The ADV 7190 also incorporate WSS and CGMS-A data control generation. The device can also output the Macrovision Anticopy algorithm.

The ADV7190 modes are set up over a two wire serial bi-directional port (I^2C Compatible) with 2 slave addresses. The device is also register compatible with the ADV7172/73 encoder.

The ADV7190 is packaged in a 64-Pin LQFP package.

DATA PATH DESCRIPTION.

For PAL B,D,G,H,I,M,N and NTSC M modes, YCrCb 4:2:2 Data is input via the CCIR-656 /601 compatible Pixel Port at a 27MHz Data Rate.The Pixel Data is de-multiplexed to form three data paths. Y has typically a range of 16 to 235, Cr and Cb have typically a range of 128+/-112, however it is possible to input data from 1 to 254 on both Y,Cb and Cr. The ADV7190 supports PAL (B,D,G,H,I,N,M), PAL 60 and NTSC (with and without Pedestal) standards. Digital Noise Reduction can be applied to the Y signal. Programmable gamma correction can also be applied to the Y signal, if required.

The Y data can be manipulated for contrast control and a setup level can be added for brightness control. The Cr, Cb data can be scaled to achieve color saturation control. All settings become effective at the start of the next field when double buffering is enabled.

The appropriate sync, blank and burst levels are added to the YCrCb data. Macrovision Anti-Taping , Closed-Captioning and Teletext levels are also added to Y and the resultant data is interpolated to 54MHz when 4xOversampling is enabled. The interpolated data is filtered and scaled by three digital FIR filters.

The U and V Signals are modulated by the appropriate Sub-Carrier Sine/Cosine waveforms and a phase offset may be added onto the color subcarrier during active video to allow hue adjustment. The resulting U and V signals are added together to make up the Chrominance Signal. The Luma (Y) signal can be delayed by up to 6 clock cycles and the Chroma signal can be delayed by up to 8 clock cycles (clock cycle at 27MHz). The Luma and Chroma signals are added together to make up the Composite Video Signal. All timing signals are controlled.

The YCrCb Data is also used to generate RGB data with appropriate sync and blank levels. The YUV signals are scaled to output the suitable SMPTE or Betacam levels.

Each DAC can be individually powered off if not required. A complete description of DAC output configurations is given on page 40.

Video output levels are illustrated in Appendix 9.

INTERNAL FILTER RESPONSE

The Y Filter supports several different frequency responses including two low-pass responses, two notch responses, an Extended (SSAF) response with or without gain boost/ attenuation, a CIF response and a QCIF response. The UV Filter supports several different frequency responses including five low-pass responses, a CIF response and a QCIF response, as can be seen in the figures on the following pages.

In Extended Mode there is the option of twelve responses in the range from -4dB to +4dB. The desired response can be chosen by the user by programming the correct value via the I^2C. The variation of frequency responses can be seen in the figures on the following pages.

FILTER TYPE	FILTER SELECTION			PASSBAND RIPPLE[1] (dB)	3dB BANWIDTH[2] (MHz)	STOPBAND CUTOFF[3](MHz)	STOPBAND ATTENUATION[4](dB)
	MR04	MR03	MR02				
LOW PASS (NTSC)	0	0	0	0.09	4.158	6.05	-65.7
LOW PASS (PAL)	0	0	1	0.15	4.74	6.41	-81.1
NOTCH (NTSC)	0	1	0	0.09	2.26/5.0/6.54	8.03	-88
NOTCH (PAL)	0	1	1	0.095	3.07/5.8/6.24	8.02	-80.5
EXTENDED (SSAF)	1	0	0	0.017	6.37	8.03	-87.4

Figure 8. Chrominance Internal Filter Specifications (4xOversampling)

[1] Passband Ripple refers to the maximum fluctuations from the 0dB response in the passband, measured in [dB]. The pass band is defined to have 0 [Hz] to fc [Hz] frequency limits for a low pass filter, 0[Hz] to f1[Hz] and f2 [Hz] to infinity for a notch filter, where fc, f1, f2 are the -3dB points.

[2] 3dB bandwidth refers to the -3dB cut off frequency.

[3] Stopband Cutoff refers to the frequency [MHz] at attenuation point [dB] refered to under note 4.

[4] Stopband Attenuation refers to the attenuation[dB] at the frequency [MHz] refered to under note 3.

EATURES- FUNCTIONAL DESCRIPTION

BRIGHTNESS LEVEL DETECT

This feature is used to monitor the average brightness of the incoming Y signal on a field by field basis. The information is read from the I2C and based on this information the saturation, contrast and brightness controls can be adjusted (for example to compensate for very dark pictures). [Brightness Detect Register].

CHROMA/LUMA DELAY

The luminance data can be delayed by a maximum of 6 clock cycles. Additionally the Chroma can be delayed by a maximum of 8 clock cycles (one clock cycle at 27 MHz). [Timing Register 0 and Mode Register 9].

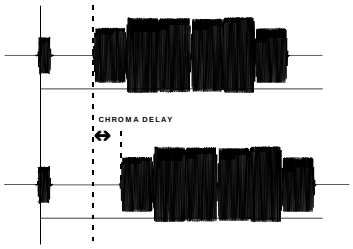

Figure 27 Chroma Delay

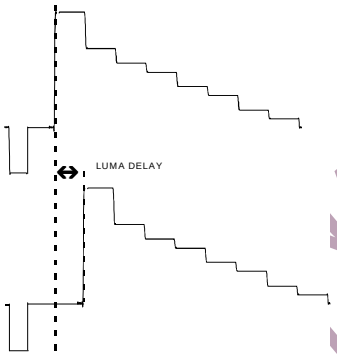

Figure 28 Luma Delay

CLAMP OUTPUT

The ADV7190 has a programmable clamp TTL output signal. This clamp signal is programmable to the front and back porch. The clamp signal can be varied by 1-3 clock cycles in a positive and negative direction from the default position. [Mode Register 5, Mode Register 7]

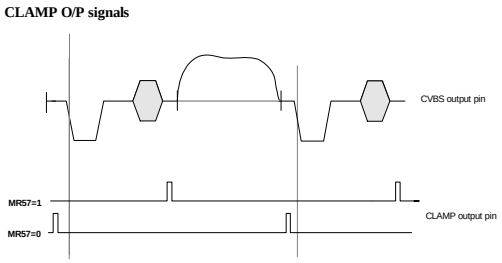

Figure 29 Clamp output timing

$\overline{\text{CSO}}$, $\overline{\text{HSO}}$ AND $\overline{\text{VSO}}$ OUTPUTS

The ADV7190 supports 3 output timing signals, CSO (composite sync signal), HSO (horizontal sync signal) and VSO (vertical sync signal). These output TTL signals are aligned with the analog video outputs. See figure below for an example of these waveforms. [Mode Register 7].

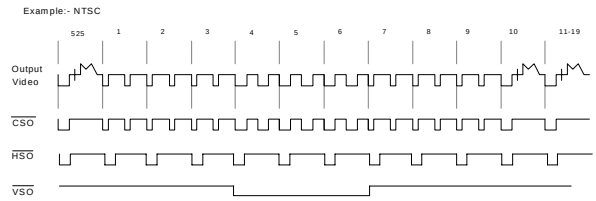

Figure 30 $\overline{\text{CSO\_HSO}}$, $\overline{\text{VSO}}$ timing diagram

COLOR BAR GENERATION

The ADV7190 can be configured to generate 100/7.5/75/7.5 colorbars for NTSC or 100/0/75/0 colorbars for PAL. [Mode Register 4].

COLOR BURST SIGNAL CONTROL

The burst information can be switched on and off the composte and chroma video output. [Mode Register 4].

COLOR CONTROLS

The ADV7190 allows the user to control the brightness, contrast, hue and saturation of the colour. The control registers may be double buffered, meaning that any modification to the registers will be done outside the active video region and therefore changes made will not be visible during active video.

Contrast Control

Contrast adjustment is achieved by scaling the Y input data by a factor programmed by the user. This factor allows the data to be scaled between 0 and 150%. [Contrast Control Register]

Brightness Control

The brightness is controlled by adding a programmable setup level onto the scaled Y data.

For NTSC with pedestal the setup can vary from 0 to 30 IRE. For NTSC without pedestal and PAL the setup can vary from -7.5 to 22.5IRE. [Brightness Control Register]

Color Saturation Control

Color adjustment is achieved by scaling the Cr and Cb input data by a factor programmed by the user. This factor allows the data to be scaled between 0% and 200% .
[U Scale Register and V Scale Register].

Hue Control

The hue adjustment is achieved on the composite and chroma outputs by adding a phase offset onto the color subcarrier in the active video but leaving the color burst unmodified i.e. only the phase between the video and the colorburst is modified and hence the hue is shifted. The ADV7190 provides a range of +/- 22° in increments of 0.17578125°. [Hue Adjust Register].

CHROMINANCE CONTROL

The color information can be switched on and off the composte, chroma and color component video outputs. [Mode Register 4].

UNDERSHOOT LIMITER

A limiter is placed after the digital filters. This prevents any synchronization problems for TVs. The level of undershoot is programmable between -1.5 IRE, -6 IRE, -11 IRE when operating in 4xOversampling. In 2xOversampling mode the limits are -7.5 IRE and 0 IRE. [Mode Register 9 and Timing Register 0].

DIGITAL NOISE REDUCTION
DNR is applied to the Y data only. A filter block selects the high frequency , low amplitude components of the incoming signal ('DNR Input Select'). The absolute value of the filter output is compared to a programmable threshold value ('DNR Threshold Control').
There are two DNR modes available: DNR Mode and DNR Sharpness Mode.
In DNR Mode, if the absolute value of the filter output is smaller than the threshold, it is assumed to be noise. A programmable amount ('Coring Gain' Control) of this noise signalwill be subtracted from the original signal.
In DNR Sharpness Mode, if the absolute value of the filter output is less than the programmed threshold, it is assumed to be noise, as before. Otherwise if the level exceeds the threshold, now being identified as a valid signal, a fraction of the signal ('Coring Gain' Control) will be added to the original signal in order to boost high frequency components and to sharpen the video image.

In MPEG systems it is common to process the video information
in blocks of 8x8 pixels for MPEG2 systems or 16x16 pixels for
MPEG1 systems ('Block Size Control'). DNR can be applied to the resulting block transition areas which are known to contain noise. Generally the block transition area contains 2 pixels. It is possible to define this area to contain 4 pixels ('Border Area Control').
It is also possible to compensate for variable block positioning or
differences in YCrCb pixel timing with the use of the ('Block Offset Control'). (See page 52 for further information).
[Mode Register 8, DNR Registers 0 -2].

DOUBLE BUFFERING
Double buffering can be enabled or disabled on the following registers: Closed Captioning Registers, Color Control Registers (Brightness, Saturation, Contrast, Hue), the Gamma Curve Select Bit and the Macrovision Registers. These registers are updated once per Field on the falling edge of the $\overline{\text{VSYNC}}$ signal. Double Buffering improves the overall performance of the ADV7190, since modifications to register settings will not be made during active video but start to take effect on the start of the active video. [Mode Register 8].

GAMMA CORRECTION CONTROL
Gamma correction may be performed on the Luma data. The user has the choice to use either of two different gamma curves, A or B. At any one time one of these curves is operational, if gamma correction is enabled. Gamma correction allows the mapping of the Luma data to a user defined function.
(See page 55 for a more detailed description).
[Mode Register 8, Gamma Registers 0-13].

NTSC PEDESTAL CONTROL
In NTSC mode it is possible to have the pedestal signal generated on the output video signal.
[Mode Register 2].

POWER-ON RESET
After power-up, it is necessary to execute a $\overline{\text{RESET}}$ operation. A Reset occurs on the falling edge of a high to low transistion on the $\overline{\text{RESET}}$ pin. This initializes the pixel port such that the data on the pixel inputs is ignored. See Appendix 8 for the register settings after $\overline{\text{RESET}}$ is applied. See page 29 for $\overline{\text{RESET}}$ timing sequence.

REAL TIME CONTROL AND SUBCARRIER RESET AND TIMING RESET
Together with the SCRESET/RTC/TR pin and Mode Register 4 ('Genlock Control'), the ADV7190 can be used in (a) Timing Reset Mode, (b) Subcarrier Phase Reset Mode or (c) RTC Mode.

(a) A TIMING RESET is achieved in bringing this pin high. In this state the horizontal and vertical counters will remain reset. On releasing this pin (set to low), the internal counters will commence counting again. The minimum time the pin has to be held high is 37ns (1 clock cycle at 27MHz), otherwise this reset signal might not be recognized.

(b)The SUBCARRIER PHASE will reset to that of Field 0 at the start of the following field when a low to high transition occurs on this input pin.

(c) In RTC MODE, the ADV7190 can be used to lock to an external video source.
The real time control mode allows the ADV7190 to automatically alter the subcarrier frequency to compensate for line length variation. When the part is connected to a device that outputs a digital datastream in the RTC format (such as a ADV7185 video decoder, the part will automatically change to the compensated subcarrier frequency on a line by line basis. This digital datastream is 67 bits wide and the subcarrier is contained in Bits 0 to 21. Each bit is 2 clock cycles long. 00Hex should be written into all four Subcarrier Frequency registers when using this mode.[Mode Register 4].

SCH PHASE MODE

The SCH phase is configured in default mode to reset every four(NTSC) or eight (PAL) fields to avoid an accumulation of SCH phase error over time. In an ideal system, zero SCH phase error would be maintained forever, but in reality, this is impossible to achieve due to clock frequency variations. This effect is reduced by the use of a 32-bit DDS, which generates this SCH.
Resetting the SCH phase every four or eight fields avoids the accumulation of SCH phase error, and results in very minor SCH phase jumps at the start of the four or eight field sequence.
Automatically resetting the SCH phase should not be done if the video source does not have stable timing or the ADV7190 is configured in RTC mode. Under these conditions (unstable video) the Subcarrier Phase Reset Mode should be enabled but no Reset applied. In this configuration the SCH Phase will never be reset, this means that the output video will now track the unstable input video.
The Subcarrier Phase Reset when applied will reset the SCH phase to Field 0 at the start of the next field (e.g. Subcarrier Phase Reset applied in Field 5(PAL) on the start of the next field SCH phase will be reset to Field 0).
[Mode Register 4].

SLEEP MODE

If after $\overline{\text{RESET}}$, the SCRESET/RTC/TR and NTSC_PAL pins are both set high, the part ADV7190 will power up in Sleep Mode to facilitate low power consumption before all registers have been initialised. If 'Power up in Sleep Mode' is disabled (MR60= '1'), Sleep Mode control passes to the 'Sleep Mode' control in Mode Register 2 (i.e. control via I2C). [Mode Register 6 and Mode Register 2].

SQUARE PIXEL MODE

The ADV7190 can be used to operate in square pixel mode. For NTSC operation an input clock of 24.5454MHz is required. Alternatively, for PAL operation, an input clock of 29.5MHz is required. The internal timing logic adjusts accordingly for square pixel mode operation. Square Pixel mode is not available in 4xOversampling mode. [Mode Register2].

VERTICAL BLANKING DATA INSERTION AND $\overline{\text{BLANK}}$ INPUT

It is possible to allow encoding of incoming YCbCr data on those lines of VBI that do not have line sync or pre/post-equalisation pulses. This mode of operation is called "Partial Blanking". It allows the insertion of any VBI data(Opened VBI) into the encoded output waveform, this data is present in the digitized incoming YCbCr data stream (e.g. WSS data, CGMS, VPS etc.). Alternatively the entire VBI may be blanked (no VBI data inserted) on these lines. VBI is available in all timing modes.

The complete VBI comprises of the following lines:
525/60 systems, Lines 525 to 21 for field one and Lines 262 to Line 284 for field two.
625/50 systems, Lines 624 to Line 22 and Lines 311 to 335.

The "Opened VBI" consists of:
525/60 systems, Lines 10 to 21 for field one and second half of Line 273 to Line 284 for field two.
625/50 systems, Line 7 to 22 and Lines 319 to 335.
[Mode Register 3]

It is possible to allow control over the BLANK signal using Timing Register 0. When the BLANK input is enabled (TR03 = '0' and input pin is tied low), the BLANK input can be used to input externally generated blank signals in Slave Mode 1, 2 or 3. When the BLANK input is disabled (TR03 = '1' and input pin is tied low or tied high), the BLANK input is not used and the ADV7190 automatically blanks all normally blank lines as per CCIR-624.

[Timing Mode Register 0].

YUV LEVELS

This functionality allows the ADV7190 to output SMPTE levels
or Betacam levels on the Y output when configured in PAL or NTSC mode.

	Sync	Video
Betacam	286mV	714mV
SMPTE	300mV	700mV

As the datapath is branched at the output of the filters the luma signal relating to the CVBS or S-Video Y/C output is unaltered. It is only the Y output of the YCrCb outputs which is scaled.This control allows UV levels to have a peak-peak amplitude of 700mV, 1000mV or the default values of 934 mV in NTSC and 700mV in PAL. [Mode Register 5].

16-BIT INTERFACE

It is possible to input data in 16-bit format. In this case the interface only operates if the data is accompanied by separate HSYNC/VSYNC/BLANK signals. 16-bit mode is not available in Slave Mode 0 since EAV/SAV timing codes are used. [Mode Register 8].

4xOVERSAMPLING AND INTERNAL PLL

It is possible to operate all six DACs at 27MHz (2xOversampling) or 54 MHz (4xOversampling).

The ADV7190 is supplied with a 27MHz clock synced with the incoming data.There are two options available: to run the device throughout at 27MHz or to enable the PLL. In the latter case even if the incoming data runs at 27MHz, 4xOversampling and the internal PLL will output the data at 54MHz.

Note In 4xOversampling Mode the requirements for the optional output filters are different than from those in 2xOversampling. See Appendix 6 for further details.

[Mode Register 1, Mode Register 6].

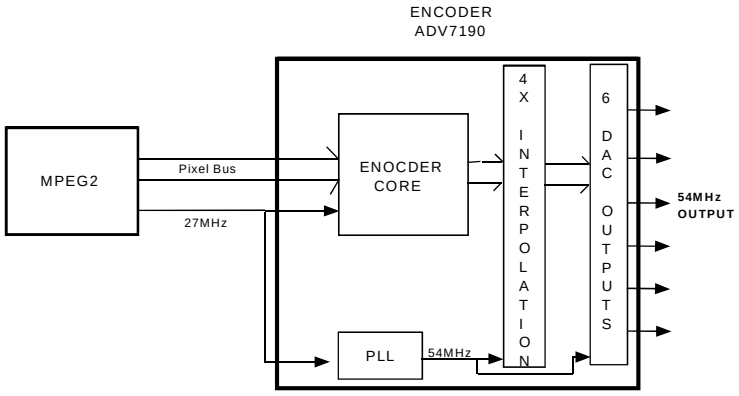

Figure 31 PLL and 4xOversampling block diagram

VIDEO TIMING DESCRIPTION.

The ADV7190 is intended to interface off-the-shelf MPEG1 and MPEG2 Decoders. As a consequence the ADV7190 accepts 4:2:2 YCrCb Pixel Data via a CCIR-656 Pixel Port and has several Video Timing Modes of operation that allow it to be configured as either System Master Video Timing Generator or a Slave to the System Video Timing Generator. The ADV7190 generates all of the required horizontal and vertical timing periods and levels for the analog video outputs.

The ADV7190 calculates the width and placement of analog sync pulses, blanking levels and color burst envelopes.Color bursts are disabled on appropriate lines and serration and equalisation pulses are inserted where required.

In addition the ADV7190 supports a PAL or NTSC square pixel operation. The part requires an input pixel clock of 24.5454MHz for NTSC square pixel mode and an input pixel clock of 29.5MHz for PAL square pixel mode. The internal horizontal line counters place the various video waveform sections in the correct location for the new clock frequencies.

The ADV7190 has 4 distinct Master and 4 distinct Slave timing configurations. Timing Control is established with the bi-directional $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$ and $\overline{\text{VSYNC}}$ pins. Timing Mode Register 1 can also be used to vary the timing pulse widths and where they occur in relation to each other.
[Mode Register 2, Timing Register 0].

RESET SEQUENCE

When $\overline{\text{RESET}}$ becomes active the ADV7190 reverts to the default output configuration (see Appendix 8 for register settings).
The ADV7190 internal timing is under the control of the logic level on the NTSC_PAL pin.
When $\overline{\text{RESET}}$ is released Y, Cr, Cb values corresponding to a black screen are input to the ADV7190. Output timing signals are still suppressed at this stage. DACs A,B C are switched off and DACs D,E, F are switched on.
When the user requires valid data, 'Pixel Data Valid' Control is enabled (MR26 = '1') to allow the valid pixel data to pass through the encoder. Digital output timing signals become active and the encoder timing is now under the control of the Timing Registers. If at this stage, the user wishes to select a different video standard to that on the NTSC_PAL pin, 'Standard I2C' Control should be enabled (MR25 = '1') and the video standard required is selected by programming Mode Register 0 ('Output Video Standard Selection'). Figure 32 illustrates the $\overline{\text{RESET}}$ sequence timing.

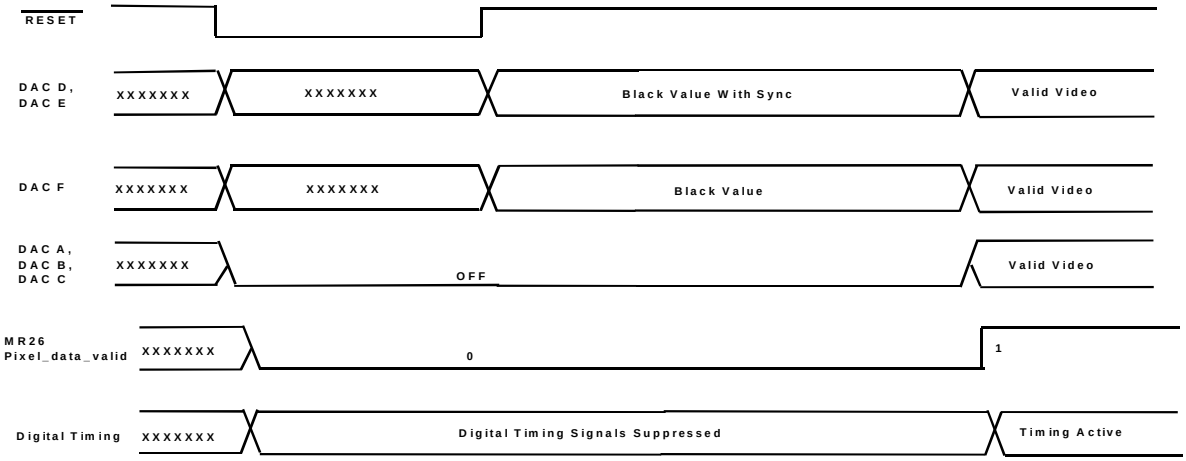

Figure 32. $\overline{\text{RESET}}$ Sequence Timing Diagram

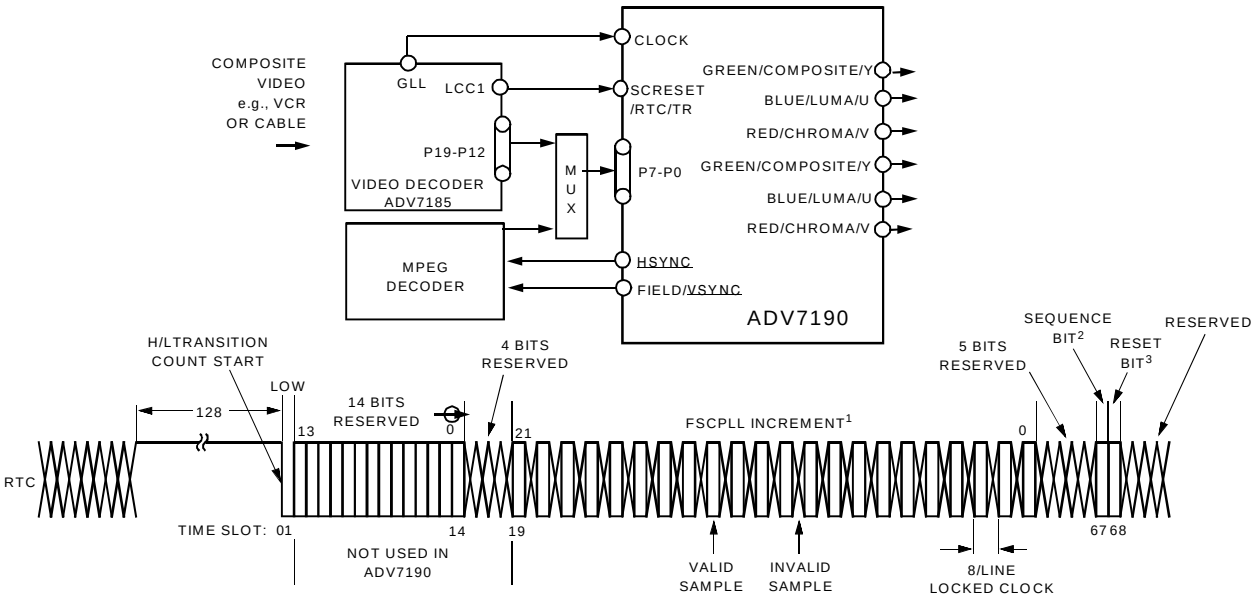

NOTES:
[1]F_{SC} PLL INCREMENT IS 22 BITS LONG, VALUED LOADED INTO ADV7190 FSC DDS REGISTER IS F_{SC} PLL INCREMENTS BITS 21:0 PLUS BITS 0:9 OF SUB CARRIER FREQUENCY REGISTERS. ALL ZEROS SHOULD BE WRITTEN TO THE SUB CARRIER FREQUENCY REGISTERS OF THE ADV7190.

[2]SEQUENCE BIT
PAL: 0 = LINE NORMAL, 1 = LINE INVERTED
NTSC: 0 = NO CHANGE.

[3]RESET BIT
RESET ADV7190's DDS.

Figure 33. RTC Timing and Connections

Mode 0 (CCIR-656) :- Slave Option.
(Timing Register 0 TR0 = X X X X X 0 0 0)

The ADV7190 is controlled by the SAV (Start Active Video) and EAV (End Active Video) Time Codes in the Pixel Data. All timing information is transmitted using a 4-byte Synchronisation Pattern. A Synchronisation pattern is sent immediately before and after each line during active picture and retrace. Mode 0 is illustrated in Figure 34. The $\overline{\text{HSYNC}}$, $\overline{\text{VSYNC}}$ and $\overline{\text{BLANK}}$ (if not used) pins should be tied high during this mode.

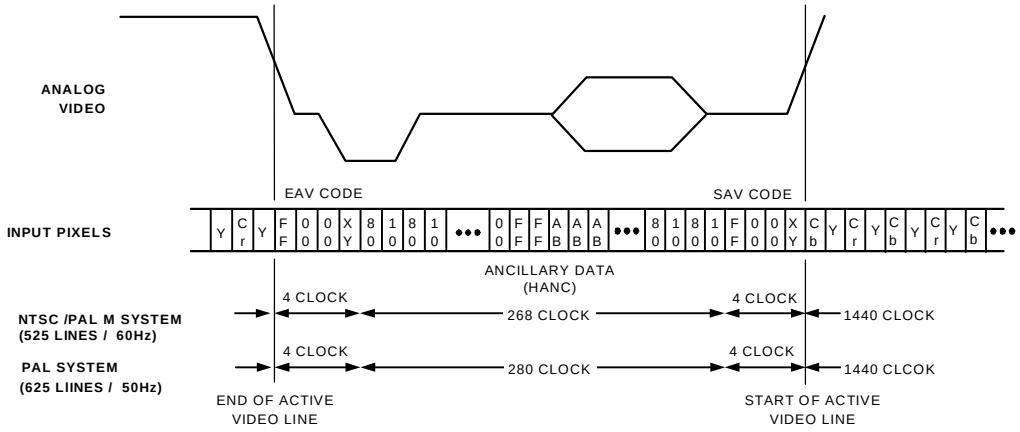

Figure 34. Timing Mode 0 (Slave Mode)

Mode 0 (CCIR-656) :- Master Option.
(Timing Register 0 TR0 = X X X X X 0 0 1)

The ADV7190 generates H, V and F signals required for the SAV (Start Active Video) and EAV (End Active Video) Time Codes in the CCIR656 standard. The H bit is output on the $\overline{\text{HSYNC}}$ pin, the V bit is output on the $\overline{\text{BLANK}}$ pin and the F bit is output on the VSYNC pin. Mode 0 is illustrated in Figure 35(NTSC) and Figure36 (PAL). The H, V and F transitions relative to the video waveform are illustrated in Figure 37.

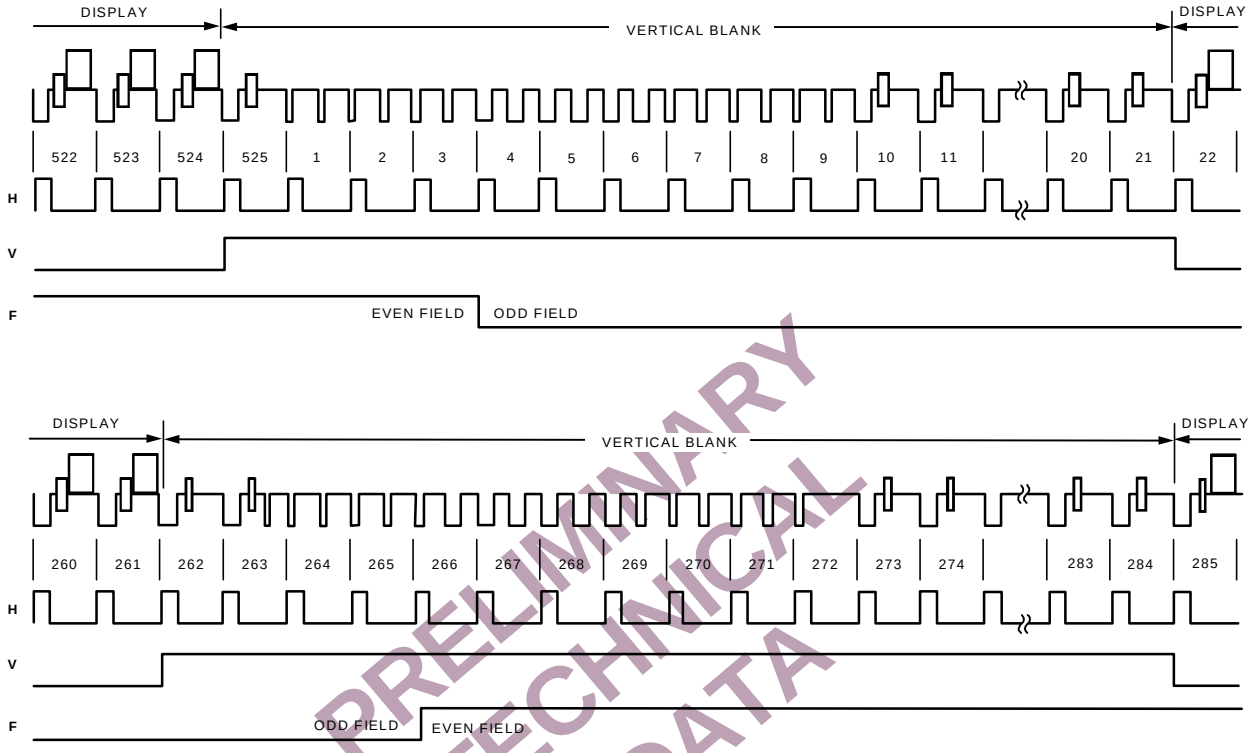

Figure 35. Timing Mode 0 (NTSC Master Mode)

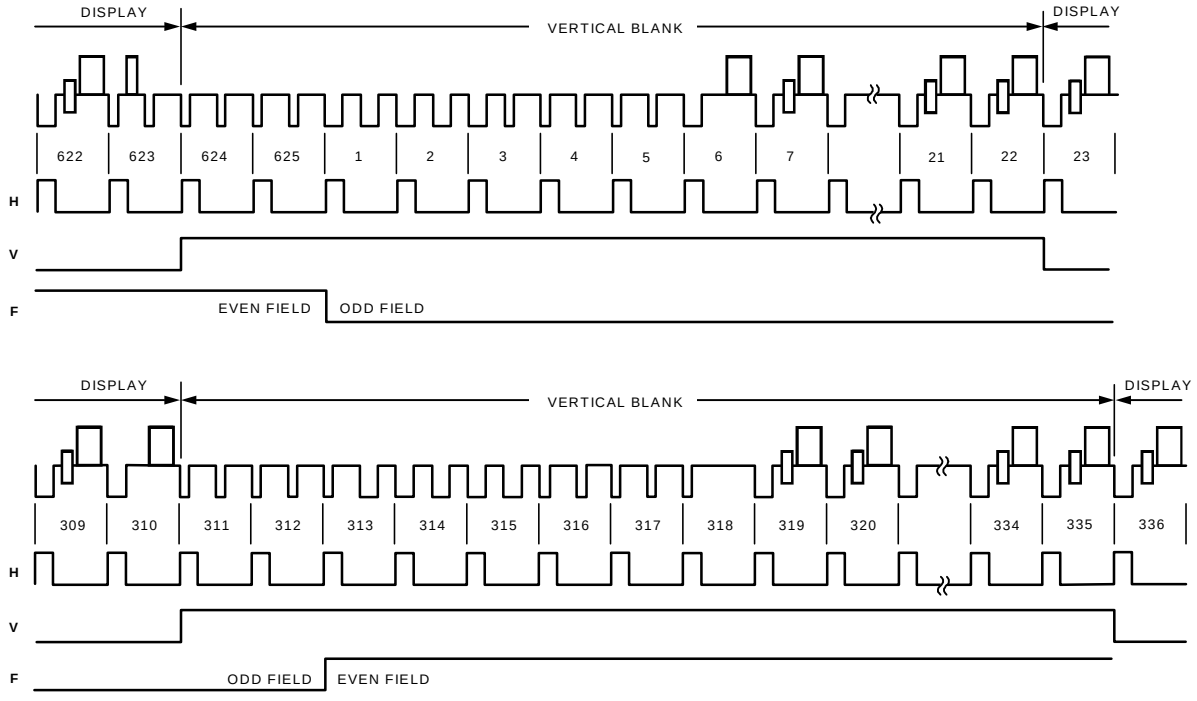

Figure 36. Timing Mode 0 (PAL Master Mode)

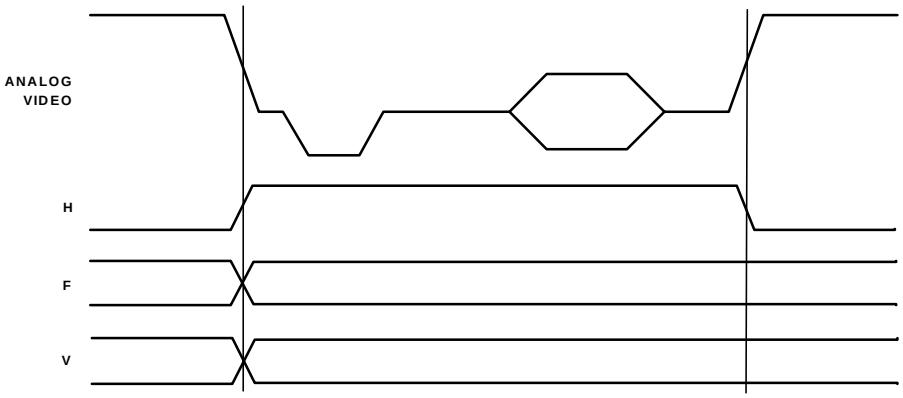

Figure 37 Timing Mode 0 Data Transitions (Master Mode)

Mode 1 :- Slave Option. $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$, FIELD
(Timing Register 0 TR0 = X X X X X 0 1 0)

In this mode the ADV7190 accepts Horizontal SYNC and Odd/ Even FIELD signals. A transition of the FIELD input when $\overline{\text{HSYNC}}$ is low indicates a new frame i.e. Vertical Retrace. The $\overline{\text{BLANK}}$ signal is optional. When the $\overline{\text{BLANK}}$ input is disabled the ADV7190 automatically blanks all normally blank lines as per CCIR-624. Mode 1 is illustrated in Figure 38(NTSC) and Figure 39(PAL).

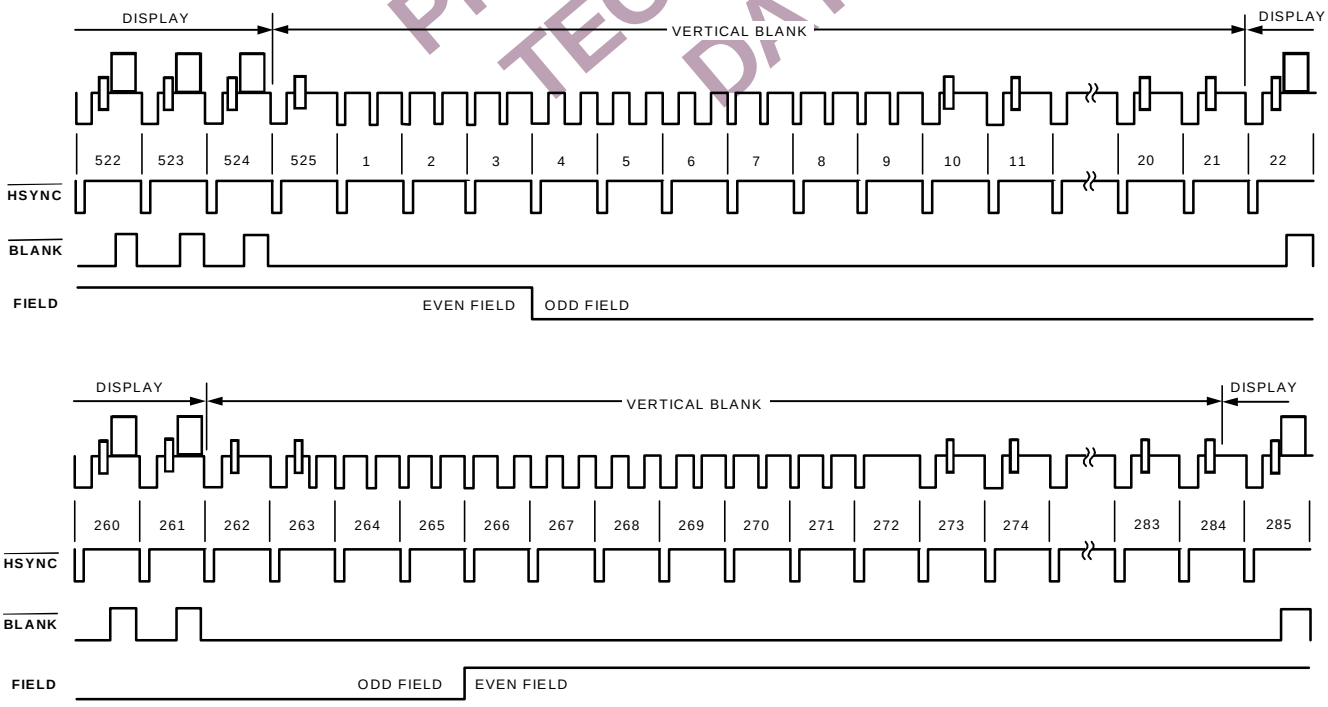

Figure 38. Timing Mode 1 (NTSC)

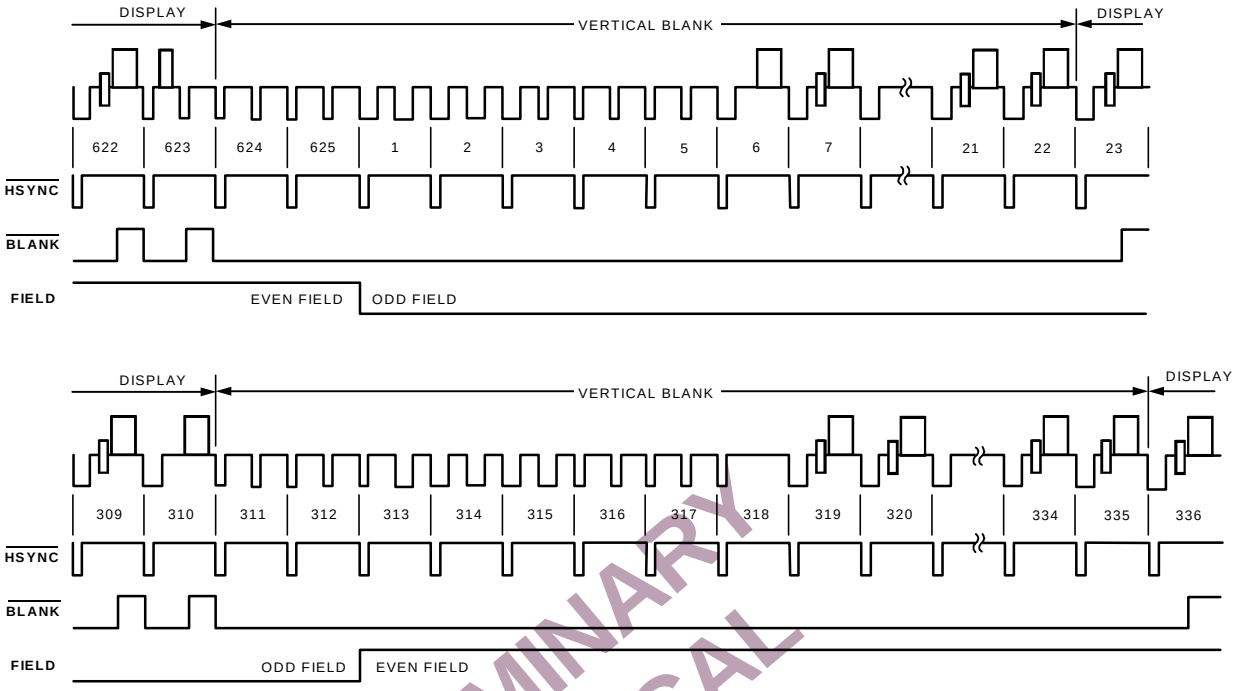

Figure 39. Timing Mode 1 (PAL)

Mode 1 :- Master Option. $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$, FIELD.
(Timing Register 0 TR0 = X X X X X 0 1 1)

In this mode the ADV7190 can generate Horizontal SYNC and Odd / Even FIELD signals. A transition of the FIELD input when $\overline{\text{HSYNC}}$ is low indicates a new frame i.e. Vertical Retrace. The $\overline{\text{BLANK}}$ signal is optional. When the $\overline{\text{BLANK}}$ input is disabled the ADV7190 automatically blanks all normally blank lines as per CCIR-624 . Pixel data is latched on the rising clock edge following the timing signal transitions. Mode 1 is illustrated in Figure 38 (NTSC) and Figure 39(PAL). Figure 40 illustrates the $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$ and FIELD for an odd or even field transition relative to the pixel data.

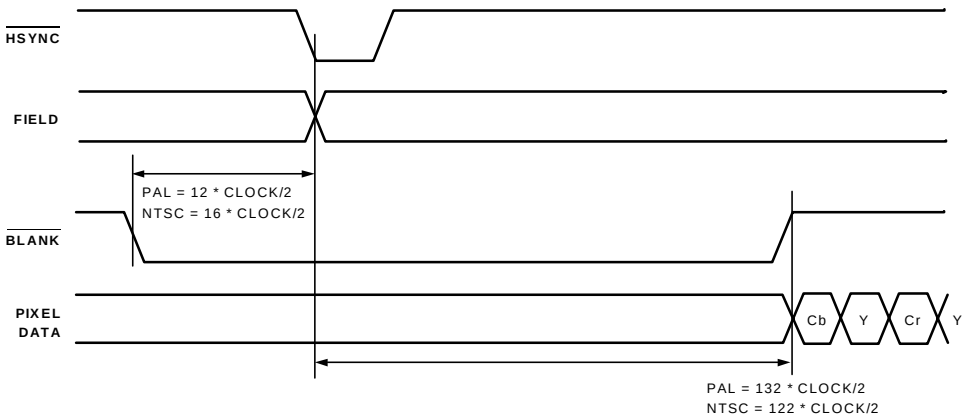

Figure 40 Timing Mode 1 Odd/Even Field Transitions Master/Slave

Mode 2 :- Slave Option $\overline{\text{HSYNC}}$, $\overline{\text{VSYNC}}$, $\overline{\text{BLANK}}$.
(Timing Register 0 TR0 = X X X X X 1 0 0)

In this mode the ADV7190 accepts Horizontal and Vertical SYNC signals. A coincident low transition of both $\overline{\text{HSYNC}}$ and $\overline{\text{VSYNC}}$ inputs indicates the start of an Odd Field. A $\overline{\text{VSYNC}}$ low transition when $\overline{\text{HSYNC}}$ is high indicates the start of an Even Field. The $\overline{\text{BLANK}}$ signal is optional. When the $\overline{\text{BLANK}}$ input is disabled the ADV7190 automatically blanks all normally blank lines as per CCIR-624. Mode 2 is illustrated in Figure 41(NTSC) and Figure 42(PAL).

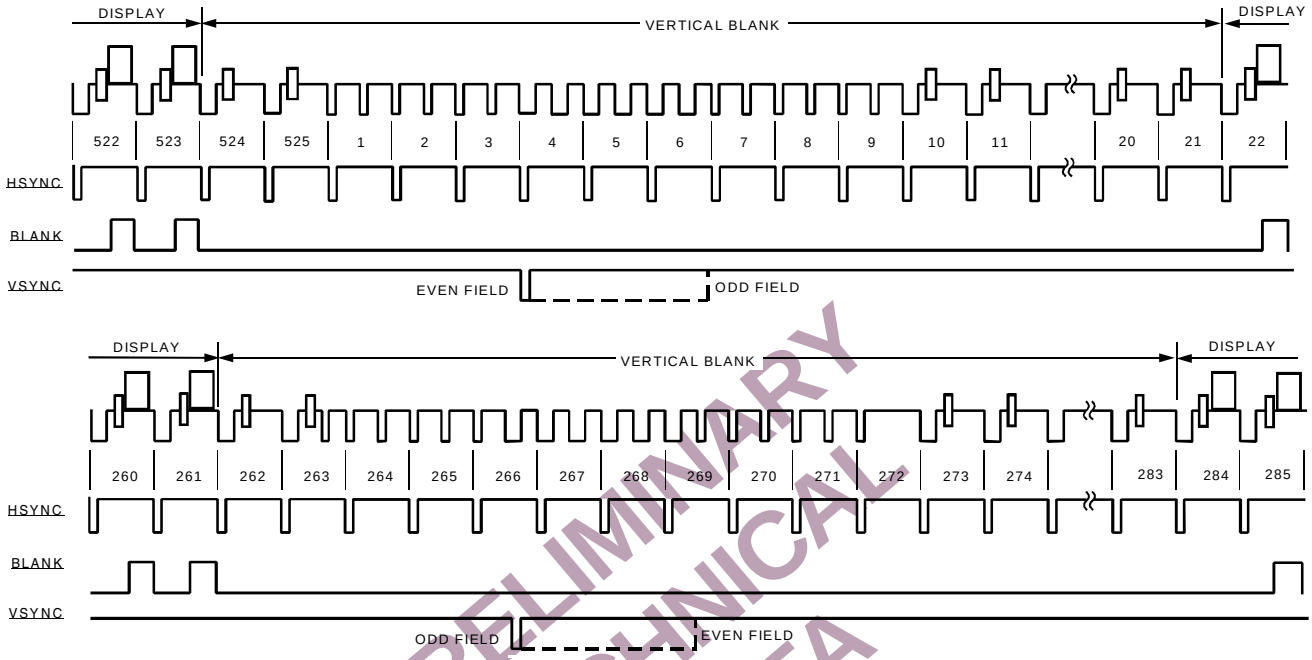

Figure 41. Timing Mode 2 (NTSC)

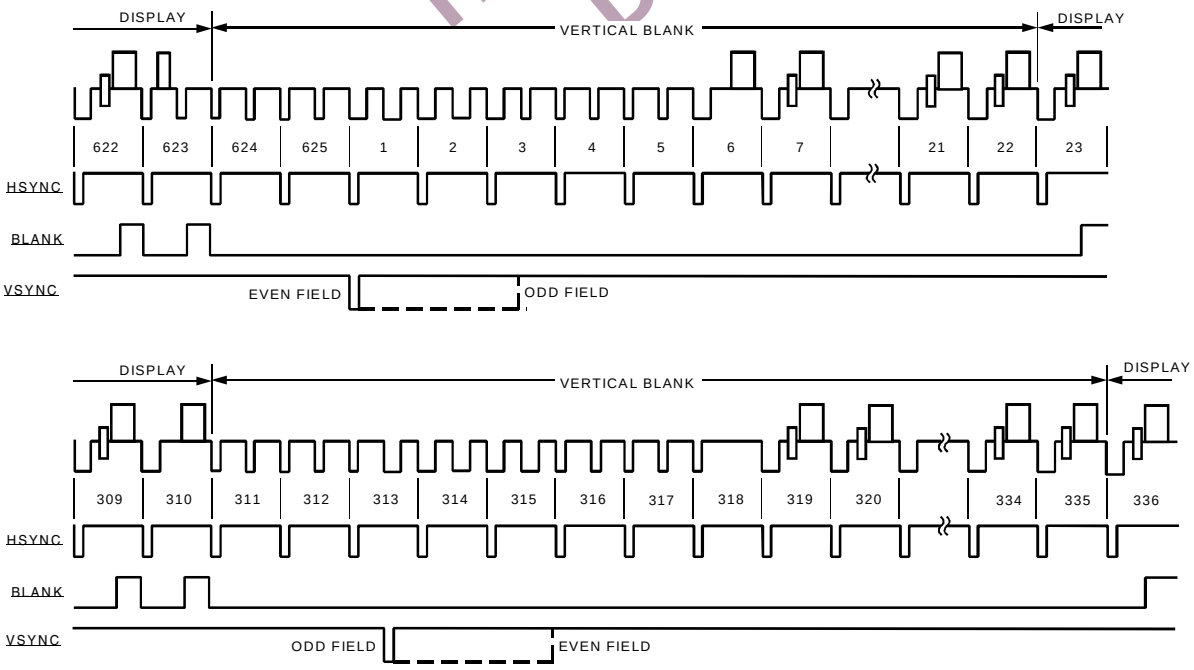

Figure 42. Timing Mode 2 (PAL)

Mode 2 :- Master Option $\overline{\text{HSYNC}}$, $\overline{\text{VSYNC}}$, $\overline{\text{BLANK}}$.
(Timing Register 0 TR0 = X X X X X 1 0 1)

In this mode the ADV7190 can generate Horizontal and Vertical SYNC signals. A coincident low transition of both $\overline{\text{HSYNC}}$ and $\overline{\text{VSYNC}}$ inputs indicates the start of an Odd Field. A $\overline{\text{VSYNC}}$ low transition when $\overline{\text{HSYNC}}$ is high indicates the start of an Even Field. The $\overline{\text{BLANK}}$ signal is optional. When the $\overline{\text{BLANK}}$ input is disabled the ADV7190 automatically blanks all normally blank lines as per CCIR-624. Mode 2 is illustrated in Figure 41 (NTSC) and Figure 42 (PAL). Figure 43 illustrates the $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$ and $\overline{\text{VSYNC}}$ for an even to odd field transition relative to the pixel data. Figure 44 illustrates the $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$ and $\overline{\text{VSYNC}}$ for an odd to even field transition relative to the pixel data.

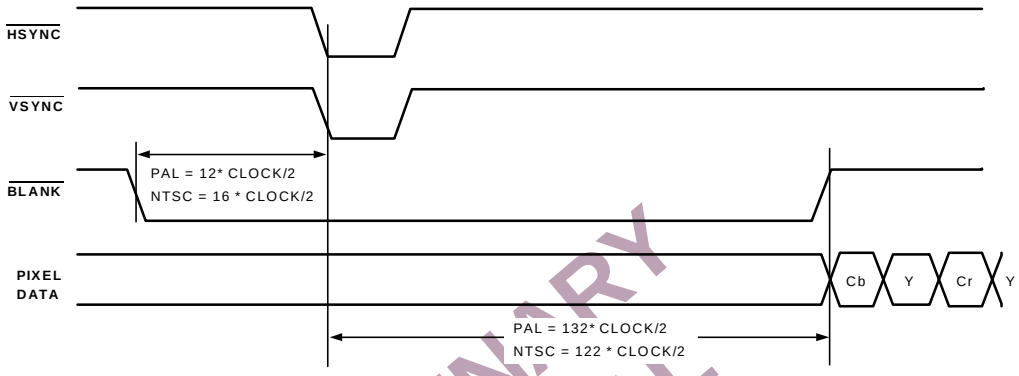

Figure 43. Timing Mode 2 Even to Odd Field Transistion Master/Slave

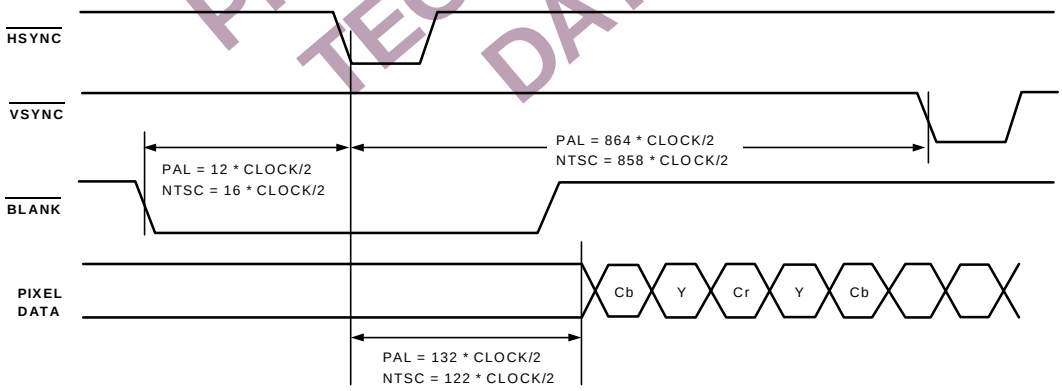

Figure 44. Timing Mode 2 Odd to Even Field Transistion Master/Slave

Mode 3 :- Master/Slave Option $\overline{\text{HSYNC}}$, $\overline{\text{BLANK}}$, FIELD.
(Timing Register 0 TR0 = X X X X X 1 1 0 or X X X X X 1 1 1)

In this mode the ADV7190 accepts or generates Horizontal SYNC and Odd / Even FIELD signals. A transition of the FIELD input when $\overline{\text{HSYNC}}$ is high indicates a new frame i.e. Vertical Retrace. The $\overline{\text{BLANK}}$ signal is optional. When the $\overline{\text{BLANK}}$ input is disabled the ADV7190 automatically blanks all normally blank lines as per CCIR-624. Mode 3 is illustrated in Figure 45 (NTSC) and Figure 46 (PAL).

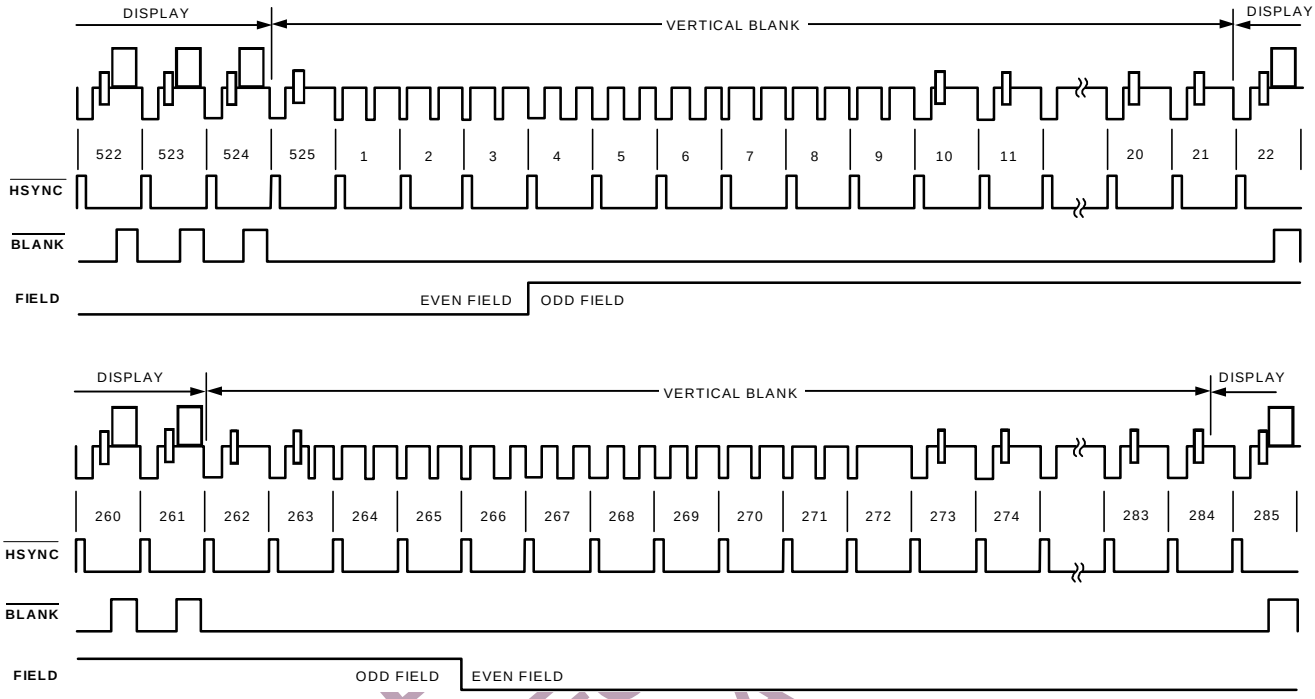

Figure 45. Timing Mode 3 (NTSC)

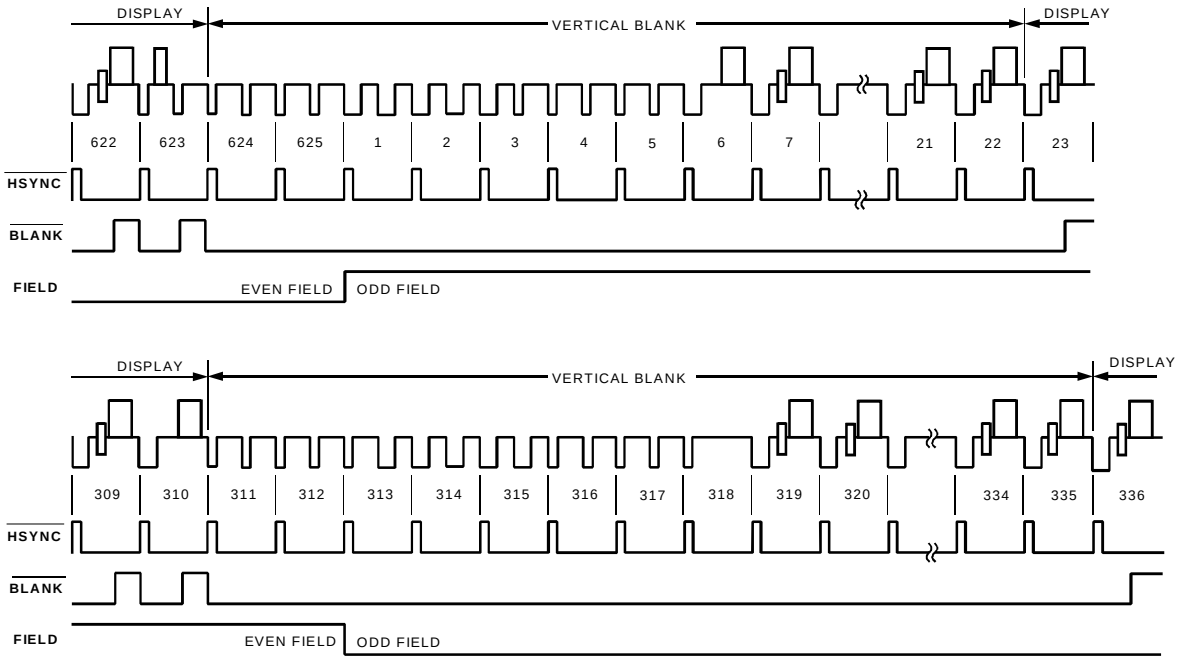

Figure 46. Timing Mode 3 (PAL)

MPU PORT DESCRIPTION.

The ADV7190 support a two wire serial (I^2C Compatible) microprocessor bus driving multiple peripherals. Two inputs Serial Data (SDA) and Serial Clock (SCL) carry information between any device connected to the bus. Each slave device is recognized by a unique address. The ADV7190 each have four possible slave addresses for both read and write operations. These are unique addresses for each device and are illustrated in Figure 47. The LSB sets either a read or write operation. Logic level "1" corresponds to a read operation while logic level "0" corresponds to a write operation. A1 is set by setting the ALSB pin of the ADV7190 to logic level "0" or logic level "1". When ALSB is set to "0", there is greater input bandwidth on the I2C lines, which allows high speed data transfers on this bus. When ALSB is set to "1", there is reduced input bandwidth on the I2C lines, which means that pulses of less than 50ns will not pass into the I2C internal controller. This mode is recommended for noisy systems.

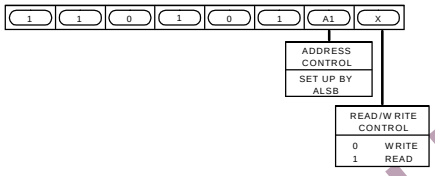

Fig 47. ADV7190 Slave Address

To control the various devices on the bus the following protocol must be followed. First the master initiates a data transfer by establishing a Start condition, defined by a high to low transistion on SDA whilst SCL remains high. This indicates that an address/data stream will follow. All peripherals respond to the Start condition and shift the next eight bits (7-Bit address + R/$\overline{W}$ bit). The bits are tranferred from MSB down to LSB. The peripheral that recognizes the transmitted address responds by pulling the data line low during the ninth clock pulse. This is known as an acknowledge bit. All other devices withdraw from the bus at this point and maintain an idle condition. The idle condition is where the device monitors the SDA and SCL lines waiting for the Start condition and the correct transmitted address. The R/$\overline{W}$ bit determines the direction of the data.

A logic "0" on the LSB of the first byte means that the master will write information to the peripheral. A logic "1" on the LSB of the first byte means that the master will read information from the peripheral.

The ADV7190 acts as a standard slave device on the bus. The data on the SDA pin is 8 bits long supporting the 7-Bit addresses plus the R/W bit. It interprets the first byte as the device address and the second byte as the starting subaddress. The subaddresses auto-increment allowing data to be written to or read from from the starting subaddress. A data transfer is always terminated by a Stop condition. The user can also access any unique subaddress register on a one by one basis without having to update all the registers. There is one exception. The Sub-Carrier Frequency Registers should be updated in sequence, starting with Sub-Carrier Frequency Register 0. The auto-increment function should be then used to increment and access Sub-Carrier Frequency Registers 1, 2 and 3. The Sub-Carrier Frequency Registers should not be accessed independently.

Stop and Start conditions can be detected at any stage during the data transfer. If these conditions are asserted out of sequence with normal read and write operations, then these cause an immediate jump to the idle condition. During a given SCL high period the user should only issue one Start condition, one Stop condition or a single Stop condition followed by a single Start condition. If an invalid subaddress is issued by the user, the ADV7190 will not issue an acknowledge and will return to the idle condition. If in auto-increment mode, the user exceeds the highest subaddress then the following action will be taken:

1. In Read Mode, the highest subaddress register contents will continue to be output until the master device issues a no-acknowledge. This indicates the end of a read. A no-acknowledge condition is where the SDA line is not pulled low on the ninth pulse.

2. In Write Mode, the data for the invalid byte will be not be loaded into any subaddress register, a no-acknowledge will be issued by the ADV7190 and the part will return to the idle condition.

Figure 48. Bus Data Transfer

Figure 48 illustrates an example of data transfer for a read sequence and the Start and Stop conditions.

Figure 49 shows bus write and read sequences.

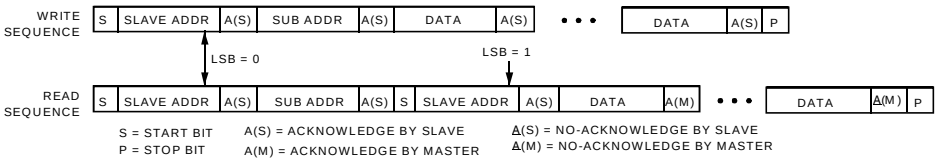

Figure 49. Write and Read Sequences

REGISTER ACCESSES

The MPU can write to or read from all of the registers of the ADV7190 except the Subaddress Registers which are write only registers. The Subaddress Register determines which register the next read or write operation accesses. All communications with the part through the bus start with an access to the Subaddress Register. Then a read/write operation is performed from/to the target address which then increments to the next address until a Stop command on the bus is performed.

REGISTER PROGRAMMING

The following section describes each register. All registers can be read from as well as written to.

Subaddress Register (SR7-SR0)

The Communications Register is an eight bit write-only register. After the part has been accessed over the bus and a read/write operation is selected, the subaddress is set up. The Subaddress Register determines to/from which register the operation takes place.

Figure 50 shows the various operations under the control of the Subaddress Register. "0" should always be written to SR7.

Register Select (SR6-SR0):

These bits are set up to point to the required starting address

Figure 50 . Subaddress Register

MODE REGISTER 0
MR0 (MR07-MR00)
(Address (SR4-SR0) = 00H)

Figure 51 shows the various operations under the control of Mode Register 0.

MR0 BIT DESCRIPTION

Video Output Standard Mode Control (MR00-MR01):
These bits are used to setup the encoder mode. The ADV7190 can be set up to output NTSC, PAL (B,D,G,H,I), PAL M or PAL N standard video.

Luminance Filter Control (MR02-MR04):
These bits specify which luma filter is to be selected. The filter selection is made independent of whether PAL or NTSC is selected.

Chrominance Filter Control (MR05-MR07):
These bits select the chrominance filter. A low pass filter can be selected with a choice of cut-off frequencies (0.65MHz, 1.0MHz, 1.3MHz, 2MHz or 3MHz) along with a choice of CIF or QCIF filters.

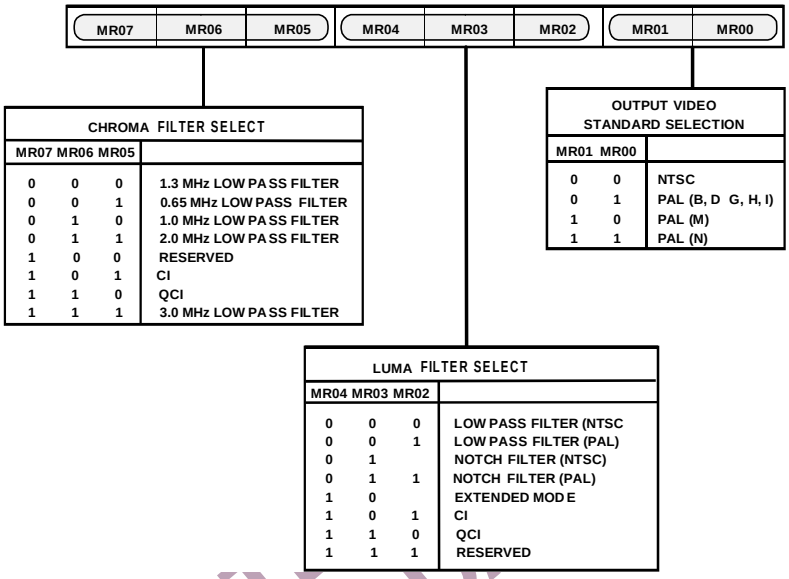

Figure 51. Mode Register 0 (MR0)

MODE REGISTER 1
MR1 (MR17-MR10)
(Address (SR4-SR0) = 01H)

Figure 52 shows the various operations under the control of Mode Register 1.

MR1 BIT DESCRIPTION

DAC Control (MR10-MR15):
Bits MR15-MR10 can be used to power down the DACs. This can be used to reduce the power consumption of the ADV7190 or if any of the DACs are not required in the application.

4XOversampling Control (MR16):
To enable 4xOversampling this bit has to be set to '1'. When enabled, the data is output at a frequency of 54 MHz.
Note that 'PLL Enable' Control has to be enabled (MR61 = " 0") in 4xOversampling mode.

Reserved (MR17)
A logical " 0" must be written to this bit.

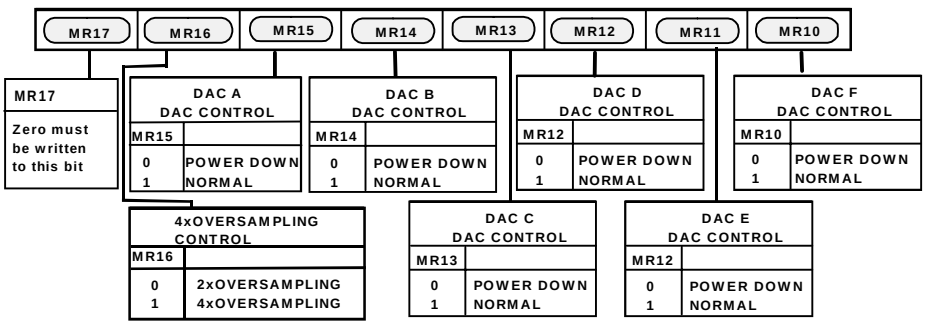

Figure 52. Mode Register 1 (MR1)

MODE REGISTER 2
MR2 (MR27-MR20)
(Address (SR4-SR0) = 02H)
Mode Register 2 is a 8-Bit wide register.

Figure 53 shows the various operations under the control of Mode Register 2.

MR2 BIT DESCRIPTION-
RGB/YUV Control (MR20):
This bit enables the output from the small or large DACs to be set to YUV or RGB output video standard.

DAC Output Control (MR21):
This bit controls the output from DACs A,B, and C. When this bit is set to "1" Composite, Luma and Chroma Signals are output from DACs A, B and C (respectively).When this bit is set to "0", RGB or YUV may be output from these DACs.

DAC Switching Control (MR22):
This bit is used to switch the DAC outputs from SCART to a EUROSCART configuration. A complete table of all DAC output configurations is shown below.

TableII. DAC Output Configuration Matrix

MR22	MR21	MR20	DAC A	DAC B	DAC C	DAC D	DAC E	DAC F
SCART	DAC O/P	RGB/ YUV						
0	0	0	G	B	R	CVBS	LUMA	CHROMA
0	0	1	Y	U	V	CVBS	LUMA	CHROMA
0	1	0	CVBS	LUMA	CHROMA	G	B	R
0	1	1	CVBS	LUMA	CHROMA	Y	U	V
1	0	0	CVBS	B	R	G	LUMA	CHROMA
1	0	1	CVBS	U	V	Y	LUMA	CHROMA
1	1	0	CVBS	LUMA	CHROMA	G	B	R
1	1	1	CVBS	LUMA	CHROMA	Y	U	V

Pedestal Control (MR23):
This bit specifies whether a pedestal is to be generated on the NTSC composite video signal. This bit is invalid when the device is configured in PAL mode.

Square Pixel Mode Control (MR24):
This bit is used to setup square pixel mode. This is available in Slave Mode only. For NTSC, a 24.54MHz clock must be supplied. For PAL, a 29.5MHz clock must be supplied. Square Pixel operation is not available in 4xOversampling mode.

Standard I²C Control (MR25):
This bit controls the video standard used by the ADV7190. When this bit is set to "1" the video standard as programmed in 'Output Video Standard' (MR00, MR01). When MR25 is set to "0", the ADV7190 is forced into the standard selected by the NTSC_PAL pin. When NTSC_PAL is low the standard is NTSC, when the NTSC_PAL pin is high, the standard is PAL.

Pixel Data Valid Control (MR26):

After resetting the device this bit has the value "0" and the pixel data input to the encoder is blanked such that a black screen is output from the DACs. The ADV7190 will be set to master mode timing. When this bit is set to "1" by the user (via the I2C), pixel data passes to the pins and the encoder reverts to the timing mode defined by Timing Mode Register 0.

Sleep Mode Enable Bit (MR27):
When this bit is set ("1"), Sleep Mode is enabled. With this mode enabled the ADV7190 current consumption is reduced to typically 0.1µA. The I²C registers can be written to and read from when the ADV7190 is in Sleep Mode.

When the device is in Sleep Mode and "0" is written to MR27, the ADV7190 will come out of Sleep Mode and resume normal operation. Also, if a $\overline{\text{RESET}}$ signal is applied during Sleep Mode the ADV7190 will come out of Sleep Mode and resume normal operation.

For this to operate, 'Power up in Sleep Mode' control has to be enabled (MR60 = "1"), otherwise Sleep Mode is controlled by the PAL_NTSC and SCRESET/RTC/TR pins.

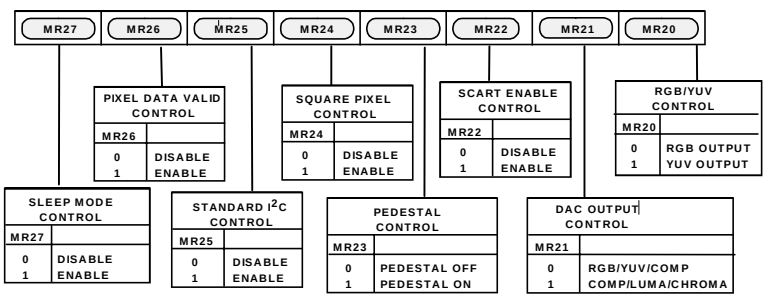

Figure 53. Mode Register 2 (MR2)

MODE REGISTER 3

MR3 (MR37-MR30)
(Address (SR4-SR0) = 03H)
Mode Register 3 is a 8-Bit wide register. Figure 54 shows the various operations under the control of Mode Register 3.

MR3 BIT DESCRIPTION
Revision Code (MR30 - MR31):
This bit is read only and indicates the revision of the device.
VBI Passthrough Control (MR32):
This bit determines whether or not data in the Vertical Blanking Interval (VBI) is output to the analog outputs or blanked. Note that this condition is also valid in timing slave mode 0. See page 26 for more information.

Teletext Enable (MR33):
This bit must be set to "1" to enable teletext data insertion on the TTX pin.

Teletext Bit Request Mode Control (MR34):
This bit enables switching of the teletext request signal from a continuous high signal (MR34 = "0") to a bitwise request signal (MR34 = "1").

Closed Captioning Field Control (MR35-MR36)
These bits control the fields that closed captioning data is displayed on, closed captioning information can be displayed on an odd field, even field or both fields.

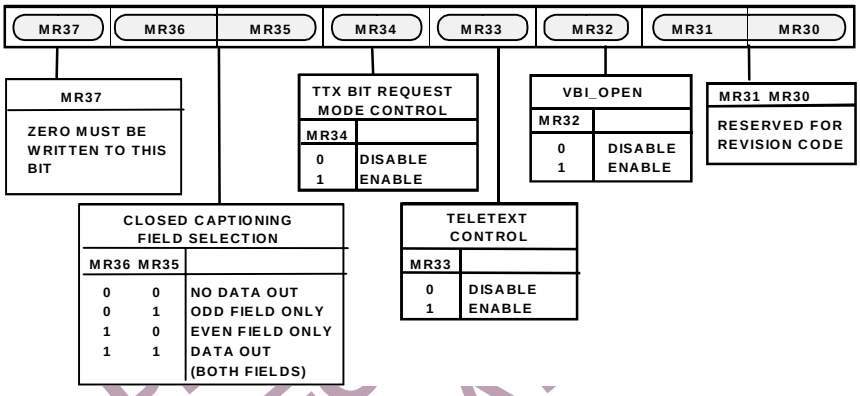

Figure 54. Mode Register 3 (MR3)

MODE REGISTER 4

MR4 (MR47-MR40)
(Address (SR4-SR0) = 04H)
Mode Register 4 is a 8-Bit wide register. Figure 55 shows the various operations under the control of Mode Register 4.

MR4 BIT DESCRIPTION
VSYNC_3H Control (MR40):
When this bit is enabled ("1") in slave mode it is possible to drive the $\overline{\text{VSYNC}}$ input LOW for 2.5 lines in PAL mode and 3 lines in NTSC mode. When this bit is enabled in master mode the ADV7190 outputs an active low $\overline{\text{VSYNC}}$ signal for 3 lines in NTSC mode and 2.5 lines in PAL mode.

Genlock Control (MR41-MR42)
These bits control the genlock feature and timing reset of the ADV7190. Setting MR41and MR42 to logic "0" disables the SCRESET/RTC/TR pin and allows the ADV7190 to operate in normal mode.
(a)By setting MR41 to "0" and MR42 to "1" a timing reset is applied, resetting the horizontal and vertical counters. This has the effect of resetting the Field Count to Field 0.
If the SCRESET/RTC/TR pin is held high, the counters will remain reset. Once the pin is released (set to low), the counters will commence counting again. For correct counter reset, the SCRESET/RTC/TR pin has to remain high for at least 37ns (1clock cycle at 27MHz).
(b) If MR41 is set to "1" and MR42 is set to "0", the SCRESET/RTC/TR pin is configured as a subcarrier reset input and the subcarrier phase will reset to Field 0 whenever a low to high transition is detected on the SCRESET/RTC/TR pin (SCH phase resets at start of the next Field).
(c) If MR41 is set to "1" and MR42 is set to "1", the SCRESET/RTC/TR pin is configured as a real time control input and the ADV7190 can be used to lock to an external video source working in RTC mode.
For more information see page 26.

Active Video Line Duration Control (MR43)
This bit switches between two active video line durations. A "0" selects CCIR Rec601 standard (720 pixels PAL/NTSC) and a "1" selects ITU-BT.470 standard for active video duration (710 pixels NTSC, 702 pixels PAL).

Chrominance Control (MR44)
This bit enables the color information to be switched on and off the composite, chroma and color component video outputs.

Burst Control (MR45)
This bit enables the color burst to be switched on and off the composite and chroma video outputs.

Color Bar Control (MR46):
This bit can be used to generate and output an internal color bar test pattern. The color bar configuration is 100/7.5/75/7.5 for NTSC and 100/0/75/0 for PAL. It is important to note that when color bars are enabled the ADV7190 is configured in a Master Timing mode. The output pins $\overline{VSYNC}$, $\overline{HSYNC}$ and $\overline{BLANK}$ are tri-state during color bar mode.

Interlaced Mode Control (MR47):
This bit is used to setup the output to interlaced or non-interlaced mode.

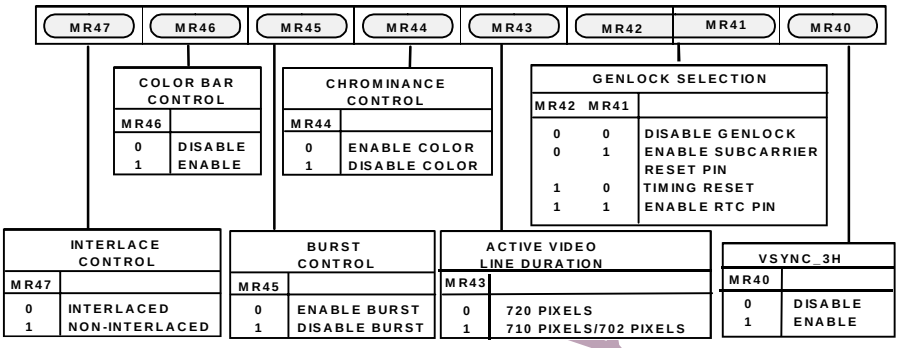

Figure55. Mode Register 4 (MR4)

MODE REGISTER 5

MR5 (MR57-MR50)
(Address (SR4-SR0) = 05H)
Mode Register 5 is a 8-Bit wide register. Figure 56 shows the various operations under the control of Mode Register 5.

MR5 BIT DESCRIPTION

Y-Level Control (MR50):
This bit controls the component Y output level on the ADV7190. If this bit is set ("0"), the encoder outputs Betacam levels when configured in PAL or NTSC mode. If this bit is set ("1"), the encoder outputs SMPTE levels when configured in PAL or NTSC.

UV-Levels Control (MR51-MR52):
These bits control the color component U and V output levels on the ADV7190. It is possible to have UV levels with a peak-peak amplitude of either 700mV (MR52+MR51 = "01") or 1000mV (MR52 + MR51 = "10") in NTSC and PAL. It is also possible to have default values of 934mV for NTSC and 700mV for PAL (MR52+ MR51 = "00").

RGB Sync (MR53):
This bit is used to set up the RGB outputs with the sync information encoded on all RGB outputs.

Clamp Delay Value (MR54-MR55):
These bits control the delay or advance of the CLAMP signal in the front or back porch of the ADV7190. It is possible to delay or advance the pulse by 0, 1, 2 or 3 clock cycles. Note: Pin 51 is a multifunctional pin ($\overline{VSO}$/CLAMP). 'CLAMP/VSO Select Control' (MR77) has to be set accordingly.

Clamp Delay Direction (MR56):
This bit controls a positive or negative delay in the CLAMP signal. If this bit is set ("1"), the delay is negative . If it is set ("0"), the delay is positive.

Clamp Position (MR57):
This bit controls the position of the CLAMP signal. If this bit is set ("1"), the CLAMP signal is located in the back porch position. If this bit is set ("0"), the CLAMP signal is located in the front porch position.

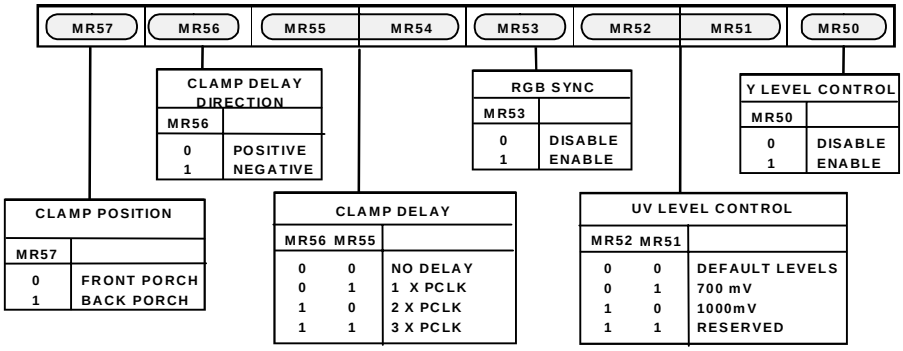

Figure 56. Mode Register 5 (MR5)

MODE REGISTER 6

MR6 (MR67-MR60)
(Address (SR4-SR0) = 06H)

Mode Register 6 is a 8-Bit wide register. Figure 57 shows the various operations under the control of Mode Register 6

MR6 BIT DESCRIPTION

Power Up Sleep Mode Control (MR60):
After $\overline{\text{RESET}}$ this control is enabled (MR60='0') if both SCRESET/RTC/TR and NTSC_PAL pins are tied high. The ADV7190 will then power up in Sleep Mode to faciliate low power comsumption while the I2C is initialised. When this control is disabled (MR60='1' , via the I2C) Sleep Mode control passes to 'Sleep Mode Control' (MR27).
If Mode Register 6, MR60 ('Power up in Sleep Mode') control is then set to ("1") then Sleep Mode control passes to Mode Register 2, MR27 ('Sleep Mode Control', i.e. control via I2C).

PLL Enable Control (MR61):
The PLL control should be enabled (MR61='0') when 4xOversampling is enabled (MR16 = '1').
When using an external Vref, subaddress register 36_h, bit 4 must be set to '1'. Also, whenever writing to this bit, the PLL must be reset (MR61).

Reserved (MR62, MR63, MR64)
A logical "0" must be written to these bits.

Field Counter (MR65, MR66, MR67):
These three bits are read only bits. The Field count can be read back over the I2C interface. In NTSC mode the Field count goes from 0-3, in PAL mode from 0-7.

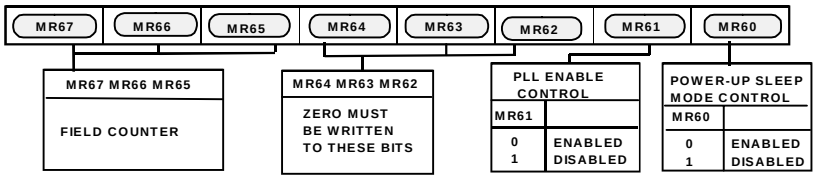

Figure 57. Mode Register 6 (MR6)

MODE REGISTER 7

MR7 (MR77-MR70)
(Address (SR4-SR0) = 07H)

Mode Register 7 is a 8-Bit wide register. Figure 58 shows the various operations under the control of Mode Register 7.

MR7 BIT DESCRIPTION

Color Control Enable Bit (MR70):
This bit is used to enable control of contrast and saturation of color. If this bit is set ("1") color controls are enabled. If this bit is set ("0"), the color control features are disabled.

Luma Saturation Control (MR71):
When this bit is set ("1"), the luma signal will be clipped if it reaches a limit that corresponds to an input luma value of 255 after scaling by the Contrast Control. This prevents the chrominance component of the composite video signal being clipped if the amplitude of the luma is too high. When this bit is set ("0"), this control is disabled.

Hue Adjust Enable Bit (MR72):
This bit is used to enable hue adjustment on the composite and chroma output signals of the ADV7190. When this bit is set ("1"), the hue of the color is adjusted by the phase offset described in the Hue Adjust Control Register. When this bit is set ("0"), hue adjustment is disabled.

Brightness Enable Bit (MR73):
This bit is used to enable brightness control on the ADV7190 by enabling the programmable "setup level" or pedestal described in the Brightness Control Register to be added to the scaled Y data. When this bit is set ("1"), brightness control is enabled. When this bit is set ("0), brightness control is disabled.

Sharpness Response Enable Bit (MR74):
This bit is used to enable the sharpness control of the luminance signal on the ADV7190 ('Luma Filter Select' has to be set to 'Extended' ,i.e MR04-MR02 = "100").The various responses of the filter are determined by the Sharpness Control Register. When this bit is set ("1") the luma response is altered by the amount described in the Sharpness Control Register. When this bit is set ("0"), the sharpness control is disabled. See figures 5, 7, 13, 23-26 for luma signal responses.

$\overline{\text{HSO}}$/$\overline{\text{CSO}}$ Output Select (MR75):
This bit is used to determine whether $\overline{\text{HSO}}$ or $\overline{\text{CSO}}$ TTL output signal is output at the $\overline{\text{CSO}}$_$\overline{\text{HSO}}$ pin. If this bit is set ("1"), then the $\overline{\text{CSO}}$ TTL signal is output. If this bit is set ("0"), then the $\overline{\text{HSO}}$ TTL signal is output.

Reserved (MR76):
A logical "0" must be written to this bit.

CLAMP/$\overline{\text{VSO}}$ Select Control (MR77):
This bit is used to select the functionality of pin51. A "1" selects CLAMP as the output signal. A "0" selects $\overline{\text{VSO}}$ output.

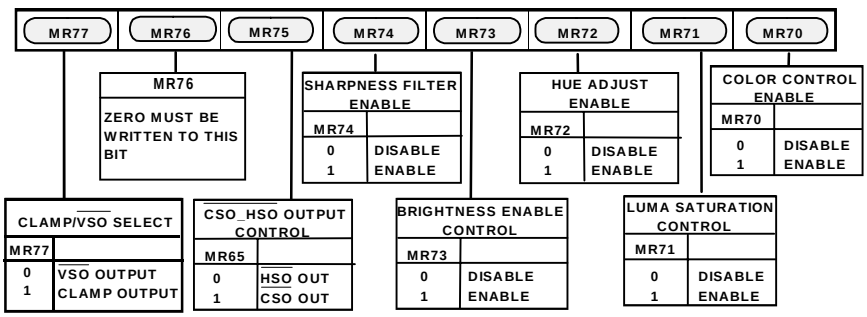

Figure 58. Mode Register 7 (MR7)

MODE REGISTER 8

MR8 (MR87-MR80)

(Address (SR4-SR0) = 07H)

Mode Register 8 is a 8-Bit wide register. Figure 59 shows the various operations under the control of Mode Register 8.

MR8 BIT DESCRIPTION

Reserved Control (MR80,MR81):

A logical '0' must be written to these bits.

Double Buffer Control (MR82):

Double Buffering can be enabled or disabled on the Contrast Control register, U Scale Register, V Scale Register, Closed Captioning Register, Brightness Control Register, Gamma Curve Select Bit and the Macrovision Registers.

16-bit Pixel Port (MR83):

This bit controls if the ADV7190 accepts 8-bit or 16-bit input data. In 8-bit mode the data will be input on Pins P0-P7.

Reserved (MR84):

A logical '0' must be written to this bit.

DNR Enable Control (MR85):

To enable the DNR process this bit has to be set to '1'.
If this bit is set to '0' the DNR processing is bypassed.
For further information on DNR controls see page 54 -57 and page 25.

Gamma Enable Control (MR86):

To enable the programmable gamma correction this bit has to be set to enabled (MR86 is set to '1'). For further information on Gamma Correction controls see page57.

Gamma Curve Select Control (MR87):

This bit selects which of the two programmable gamma curves is used. When setting MR87 to '0', the gamma correction curve to be processed is curve A. Otherwise curve B is selected. For further information on Gamma Correction controls see page 57.

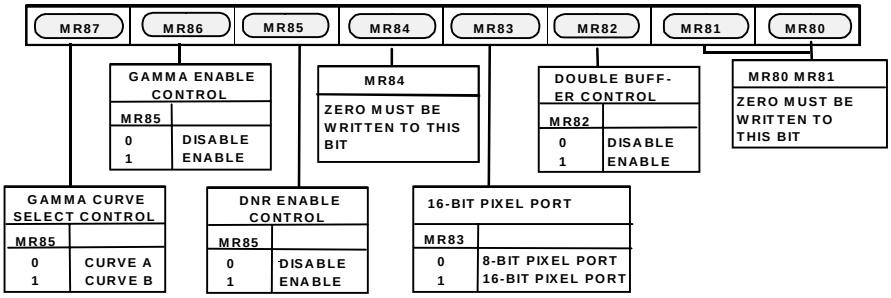

Figure 59. Mode Register 8 (MR8)

MODE REGISTER 9

MR8 (MR97-MR90)
(Address (SR4-SR0) = 08H)

Mode Register 9 is a 8-Bit wide register. Figure 60 shows the various operations under the control of Mode Register 9.

MR9 BIT DESCRIPTION

Undershoot Limiter (MR90 -MR91):
This control ensures that no luma video data will go below a programmable level.This prevents any synchronisation problems due to video signals going below the blanking level. Available limit levels are
-1.5 IRE, -6 IRE and -11 IRE.
Note that this facility is only available in 4xOversampling mode (MR16, '1'). When the device is operated in 2xOversampling mode (MR16, '0'), the minimum luma level is set in Timing Register 0, TR06 ('Min Luma Control').

Reserved (MR92,MR3):
A logic '0' must be written to these bits.

Chroma Delay Control (MR94-MR95):
The Chroma signal can be delayed by up 296 ns (8clock cycles at 27MHz) using MR94-95. For further information see page 25.

Reserved (MR96 - MR97):
A logic '0' must be written to these bits

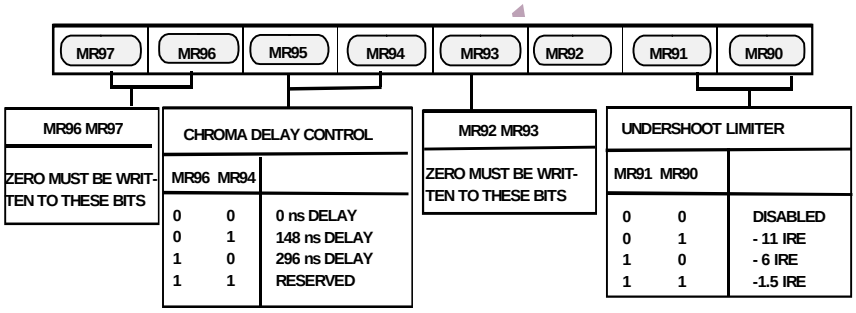

Figure 60. Mode Register 9 (MR9)

TIMING REGISTER 0 (TR07-TR00)
(Address (SR4-SR0) = 07H)

Figure 61 shows the various operations under the control of Timing Register 0. This register can be read from as well as written to.

- TR0 BIT DESCRIPTION -

Master/Slave Control (TR00):
This bit controls whether the ADV7190 is in master or slave mode.

Timing Mode Control (TR01-TR02):
These bits control the timing mode of the ADV7190. These modes are described in more detail in the Timing and Control section of the datasheet on page 28-34.

$\overline{\text{BLANK}}$ **Control (TR03):**
This bit controls whether the $\overline{\text{BLANK}}$ input is used to accept blank signals or whether blank signals are internally generated.
Note: When this input pin is tied high (to +5V), the input is disabled regardless of the register setting. It therefore should be tied low (to Ground) to allow control over the I2C registers.

Luma Delay Control (TR04-TR05):
The Luma signal can be delayed by up to 222ns (or 6 clock cycles at 27MHz) using TR04-05. For further information see page 25.

Min Luminance value (TR06):
This bit is used to control the minimum luma output value by the ADV7190 in 2xOversampling Mode (MR16='0'). When this bit is set to a logic ("1"), the luma is limited to 7.5IRE below the blank level. When this bit is set to ("0"), the luma value can be as low as the sync bottom level (40IRE below blanking).

Timing Register Reset (TR07):
Toggling TR07 from low to high and low again resets the internal timing counters. This bit should be toggled after power-up, reset or changing to a new timing mode.

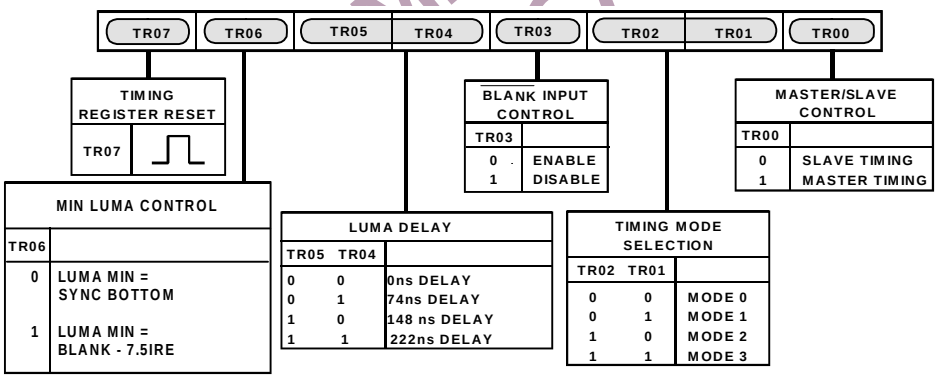

Figure 61 Timing Register 0

TIMING REGISTER 1
(TR17-TR10)
(Address (SR4-SR0) = 0BH)

Timing Register 1 is a 8-Bit wide register.

Figure 62 shows the various operations under the control of Timing Register 1. This register can be read from as well written to. This register can be used to adjust the width and position of the master mode timing signals.

TR1 BIT DESCRIPTION

$\overline{\text{HSYNC}}$ Width (TR10-TR11):
These bits adjust the $\overline{\text{HSYNC}}$ pulse width.
T_{PCLK} = one clock cycle at 27 MHz.

$\overline{\text{HSYNC}}$ to $\overline{\text{VSYNC}}$ Delay Control (TR12-TR13):
These bits adjust the position of the $\overline{\text{HSYNC}}$ output relative to the $\overline{\text{VSYNC}}$ output.
T_{PCLK} = one clock cycle at 27 MHz.

$\overline{\text{HSYNC}}$ to $\overline{\text{VSYNC}}$ Rising Edge Delay Control (TR14-TR15):
When the ADV7190 is in timing mode 1, these bits adjust the position of the $\overline{\text{HSYNC}}$ output relative to the $\overline{\text{VSYNC}}$ output rising edge.
T_{PCLK} = one clock cycle at 27 MHz.

$\overline{\text{VSYNC}}$ Width (TR14-TR15):
When the ADV7190 is configured in timing mode 2, these bits adjust the $\overline{\text{VSYNC}}$ pulse width.
T_{PCLK} = one clock cycle at 27 MHz.

$\overline{\text{HSYNC}}$ to Pixel Data Adjust (TR17-TR16):
This enables the $\overline{\text{HSYNC}}$ to be adjusted with respect to the pixel data. This allows the Cr and Cb components to be swapped. This adjustment is available in both master and slave timing modes.
T_{PCLK} = one clock cycle at 27 MHz.

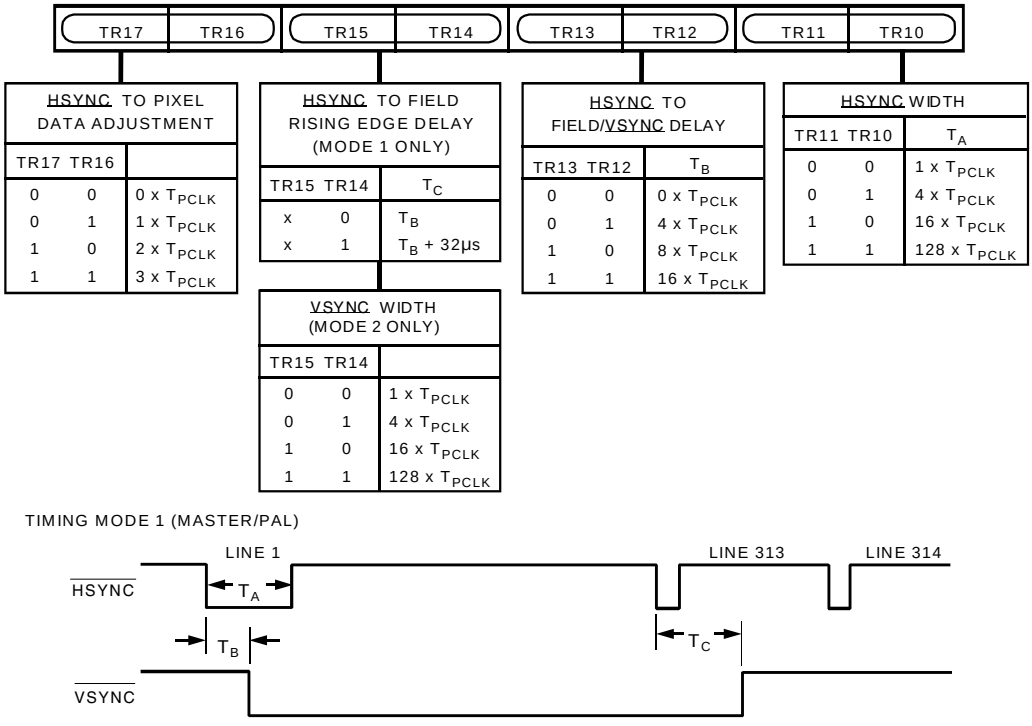

Figure 62. Timing Register 1

SUB-CARRIER FREQUENCY REGISTERS 3-0 (FSC3-FSC0)

(Address (SR4-SR0) = 0CH-0FH)

These 8-Bit wide registers are used to set up the Sub-Carrier Frequency. The value of these registers are calculated by using the following equation:

$$\text{Sub-Carrier Frequency Register} = \frac{(2^{32} - 1) * F_{SCF}}{F_{CLK}}$$

Example: NTSC Mode,
F_{CLK} = 27 MHz,
F_{SCF} = 3.5795454 MHz

$$\text{Sub-Carrier Freq Value} = \frac{(2^{32}-1) \times 3.5795454 \times 10^{6}}{27 \times 10^{6}}$$

Sub-Carrier Register Value = 21F07C16 HEX

Figure 63 shows how the frequency is set up by the four registers.

Figure 63. Sub Carrier Frequency Registers

SUB-CARRIER PHASE REGISTER (FP7-FP0):
(Address (SR4-SR0) = 10H)

This 8-Bit wide register is used to set up the Sub-Carrier Phase. Each bit represents 1.41°. For normal operation this register is set to 00Hex.

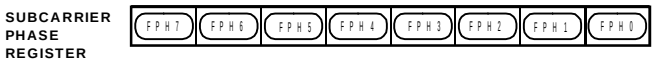

Figure 64. Subcarrier Phase Register

CLOSED CAPTIONING ODD FIELD DATA REGISTER 1-0 (CCD15-CCD00)

(Subaddress (SR4-SR0) = 13-14H)

These 8-Bit wide registers are used to set up the closed captioning data bytes on Odd Fields. Figure 66 shows how the high and low bytes are set up in the registers.

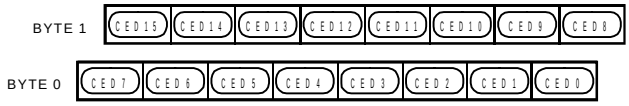

Figure 66. Closed Captioning Data Register

CLOSED CAPTIONING EVEN FIELD DATA REGISTER 1-0 (CED15-CED00)
(Address (SR4-SR0) = 11-12H)

These 8-Bit wide registers are used to set up the closed captioning extended data bytes on Even Fields. Figure 65 shows how the high and low bytes are set up in the registers.

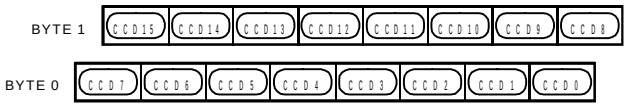

Figure 65. Closed Captioning Extended Data Register

NTSC PEDESTAL / PAL TELETEXT CONTROL REGISTERS 3-0 (PCE15-0, PCO15-0)/ (TXE15-0, TXO15-0)

(Subaddress (SR4-SR0) = 15-18H)

These 8-Bit wide registers are used to enable the NTSC pedestal/ PAL Teletext on a line by line basis in the vertical blanking interval for both odd and even fields. Figure 67/68 shows the four control registers. A logic "1" in any of the bits of these registers has the effect of turning the Pedestal OFF on the equivalent line when used in NTSC. A logic "1" in any of the bits of these registers has the effect of turning Teletext ON on the equivalent line when used in PAL .

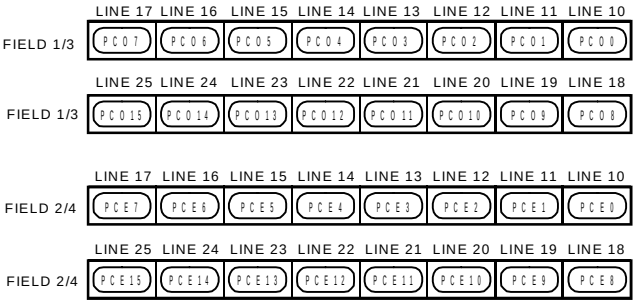

Figure 67. Pedestal Control Registers

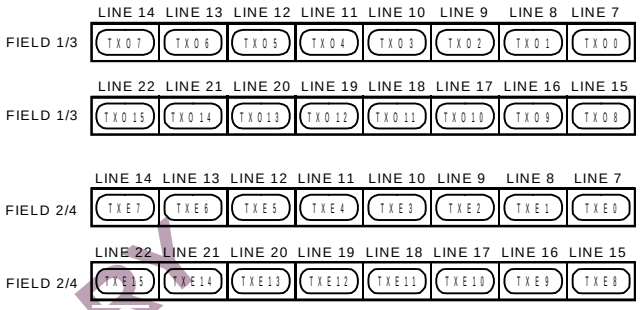

Figure 68. Teletext Control Registers

TELETEXT CONTROL REGISTER TC07 (TC07-TC00)

(Address (SR4-SR0) = 1CH)

Teletext Control Register is a 8-bit wide register. See Figure 69.

TTXREQ Falling Edge Control (TC00-TC03)

These bits control the position of the falling edge of TTXREQ. It can be programmed from zero clock cycles to a max of 15 clock cycles. This controls the active window for Teletext data. Increasing this value reduces the amount of Teletext bits below the default of 360. If Bits TC03-TC00 are 00Hex when Bits TC07-TC04 are changed then the falling egde of TTREQ will track that of the rising edge (i.e. the time between the falling and rising edge remains constant). PCLK= one clock cycle at 27MHz.

TTXREQ Rising Edge Control (TC04-TC07):

These bits control the position of the rising edge of TTXREQ. It can be programmed from zero clock cycles to a max of 15 clock cycles.
PCLK= one clock cycle at 27MHz.

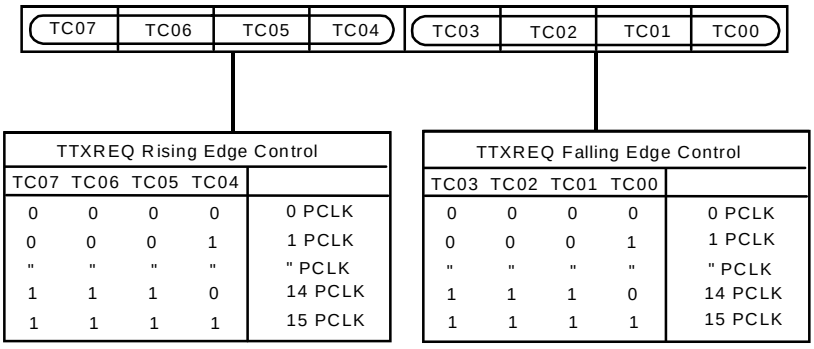

Figure 69. Teletext Control Register

CGMS_WSS REGISTER 0 C/W0 (C/W07-C/W00)
(Address (SR4-SR0) = 19H)
CGMS_WSS register 0 is an 8-bit wide register. Figure 70 shows the operations under control of this register.

-C/W0 BIT DESCRIPTION-

CGMS Data Bits (C/W00-C/W03) :
These four data bits are the final four bits of CGMS data output stream. Note it is CGMS data ONLY in these bit positions i.e. WSS data does not share this location.

CGMS CRC Check Control (C/W04) :
When this bit is enabled ("1"), the last six bits of the CGMS data i.e. the CRC check sequence is calculated internally by the ADV7190. If this bit is disabled ("0") the CRC values in the register are output to the CGMS data stream.

CGMS Odd Field Control (C/W05) :
When this bit is set ("1") CGMS is enabled for odd fields. Note this is only valid in NTSC mode.

CGMS Even Field Control (C/W06) :
When this bit is set ("1") CGMS is enabled for even fields. Note this is only valid in NTSC mode.

WSS Control (C/W07) :
When this bit is set ("1"), wide screen signalling is enabled. Note this is only valid in PAL mode.

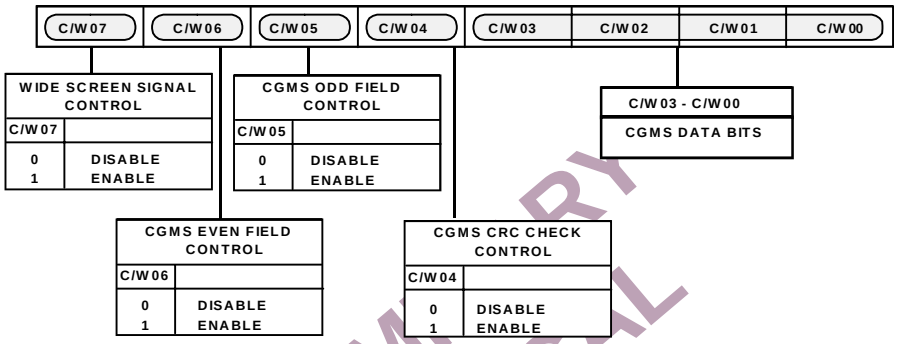

Figure 70. CGMS_WSS Register 0

CGMS_WSS REGISTER 1
C/W1 (C/W17-C/W10)
(Address (SR4-SR0) = 1AH)
CGMS_WSS register 1 is an 8-bit wide register. Figure 71 shows the operations under control of this register.

-C/W1 BIT DESCRIPTION-

CGMS/WSS Data Bits (C/W10-C/W15) :
These bit locations are shared by CGMS data and WSS data. In NTSC mode these bits are CGMS data. In PAL mode these bits are WSS data.

CGMS Data Bits (C/W16-C/W17) :
These bits are CGMS data bits only.

CGMS_WSS REGISTER 2
C/W1 (C/W27-C/W20)
(Address (SR4-SR0) = 1BH)
CGMS_WSS register 2 is an 8-bit wide register.Figure 72 shows the operations under control of this register.

-C/W2 BIT DESCRIPTION-

CGMS/WSS Data Bits (C/W20-C/W27) :
These bit locations are shared by CGMS data and WSS data. In NTSC mode these bits are CGMS data. In PAL mode these bits are WSS data.

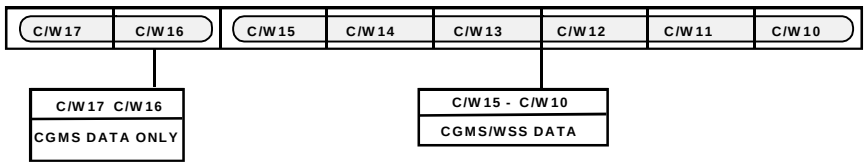

Figure 71. CGMS_WSS Register 1

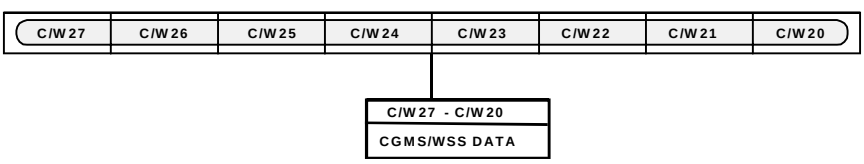

Figure 72. CGMS_WSS Register 2

CONTRAST CONTROL REGISTER
(CC07-CC00)
(Address (SR4-SR0) = 1DH)
The contrast control register is an 8-bit wide register used to scale the Y output levels. Figure 73 shows the operation under control of this register.

Y Scalar Value (CC00-CC07) :
These eight bits represent the value required to scale the Y pixel data from 0.0 to 1.5 of its initial level. The value of these eight bits is calculated using the following equation:

Y Scalar Value = Scale factor * 128

Example:

Scale factor = 1.18

Y Scalar Value = 1.18 * 128 = 151.04
Y Scalar Value= 151 (rounded to the nearest integer)
Y Scalar Value = 10010111_b
Y Scalar Value = 97_h

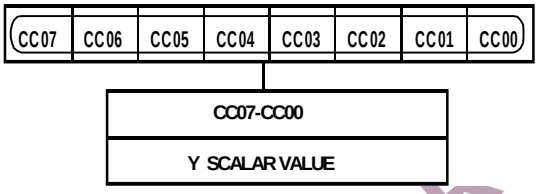

Figure 73. Contrast Control Register

COLOUR CONTROL REGISTERS 2-1
(CC2-CC1)
(Address (SR4-SR0) = 1EH-1FH)
The colour control registers are 8-bit wide registers used to scale the U and V output levels. Figure 74 shows the operations under control of these registers.

-CC1 BIT DESCRIPTION-

U -Scalar Value (CC10-CC17) :
These eight bits represent the value required to scale the U level from 0.0 to 2.0 of its initial level. The value of these eight bits is calculated using the following equation:

U Scalar Value = Scale factor * 128

Example:

Scale factor = 1.18

U Scalar Value = 1.18 * 128 = 151.04
U Scalar Value= 151 (rounded to the nearest integer)
U Scalar Value = 10010111_b
U Scalar Value = 97_h

-CC2 BIT DESCRIPTION-

V Scalar Value (CC20-CC27) :
These eight bits represent the value required to scale the V pixel data from 0.0 to 2.0 of its initial level. The value of these eight bits is calculated using the following equation:
Y Scalar Value = Scaling factor * 128

Example:

Scale factor = 1.18

V Scalar Value = 1.18 * 128 = 151.04
V Scalar Value= 151 (rounded to the nearest integer)
V Scalar Value = 10010111_b
V Scalar Value = 97_h

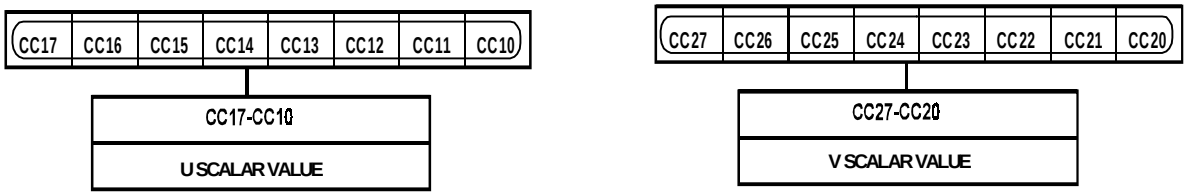

Figure 74. Color Control Registers

HUE CONTROL REGISTERS (HCR)

(Address (SR5-SR0) = 20H)

The hue control register is an 8-bit wide register used to adjust the hue on the composite and chroma outputs. Figure 75 shows the operation under control of this register.

-HCR BIT DESCRIPTION-

Hue Control Value (HCR0-HCR7) :

These eight bits represent the value required to vary the hue of the video data i.e. the variance in phase of the subcarrier during active video with respect to the phase of the subcarrier during the colorburst. The ADV7190 provides a range of +/- 22.5° increments of 0.17578125°. For normal operation (zero adjustment) this register is set to 80Hex. FFHex and 00Hex represent the upper and lower limit (respectively) of adjustment attainable.

Hue Adjust [°] = 0.17578125° x(HCR_d -128)

EXAMPLE

To adjust the hue by 4° write 97_h to the Hue Control Register:

$(4 / 0.17578125) + 128 = 151_d^* = 97_h$

* rounded to the nearest integer

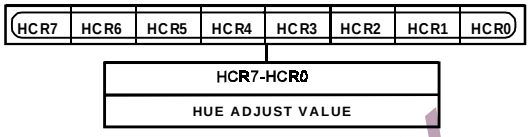

Figure 75 Hue Control Register

BRIGHTNESS CONTROL REGISTERS (BCR)

(Address (SR5-SR0) = 21H)

The brightness control register is an 8-bit wide register which allows brightness control. Figure 76 shows the operation under control of this register.

-BCR BIT DESCRIPTION-

Brightness Control Value (BCR0-BCR6) :

Seven bits of this 8-bit wide register are used to control the brightness level. The brightness is controlled by adding a programmable setup level onto the scaled Y data. This brightness level can be a positive or negative value.

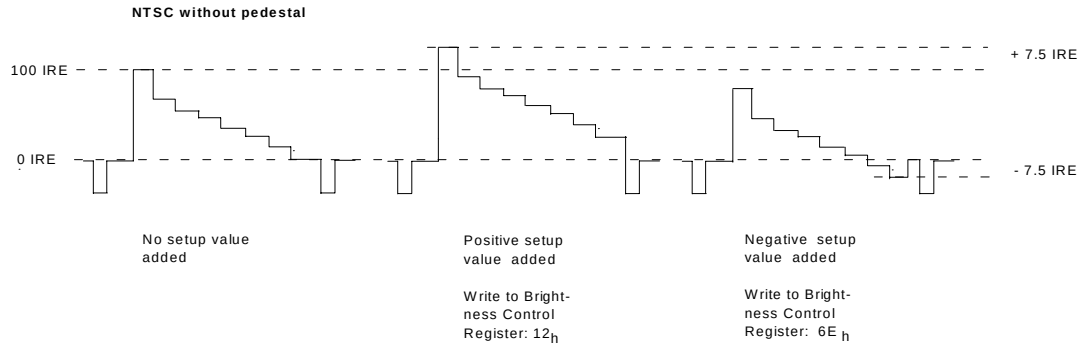
Table II illustrates what values have to be programmed into the Brightness Control Register in order to achieve according setup levels.

Table II. Brightness Control Register Values

NTSC WITH PEDESTAL	NTSC NO PEDESTAL	PAL	BRIGHTNESS CONTROL REGISTER VALUE
22.5 IRE	15 IRE	15 IRE	24_h
15 IRE	7.5 IRE	7.5 IRE	12_h
7.5 IRE	0 IRE	0 IRE	00_h
0 IRE	- 7.5 IRE	- 7.5 IRE	$6E_h$

Note: values in the range of $3F_h$ and 44_h will result in an invalid output signal.

EXAMPLE:



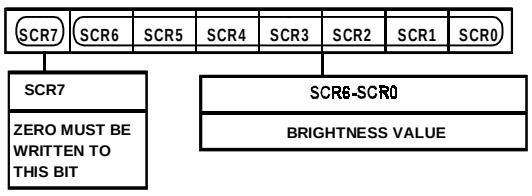


Figure 76. Brightness Control Register

SHARPNESS RESPONSE REGISTER (PR)
(Address (SR5-SR0) = 22H)

The sharpness response register is an 8-bit wide register. The four MSBs are set to "0". The four LSBs are written to in order to select a desired filter response. Figure 77 shows the operation under control of this register.

-PR BIT DESCRIPTION-

Sharpness Response Select Value (PR0-PR3) :
These four bits are used to select the desired luma filter response. Figure 77 shows the operation under control of this register. The option of twelve responses is given supporting a gain boost/attenuation in the range -4dB to +4dB. The value 12 (1100) written to these four bits corresponds to a boost of +4dB while the value 0 (0000) corresponds to -4dB. For normal operation these four bits are set to 6 (0110).
Note: 'Luma Filter Select' has to be set to 'Extended Mode' and
'Sharpness Filter' Control has to be enabled for settings in the Sharpness Response Register to take effect (MR02-04 = '100' ; MR74 = '1'). For filter response see figures 23-26.

Reserved (PR4-PR7) :
A logical "0" must be written to these bits.

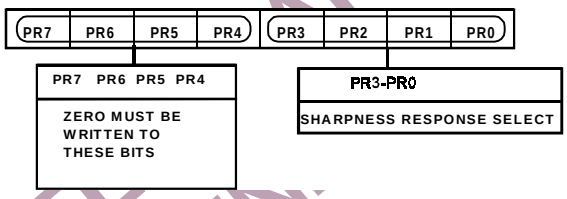

Figure 77. Sharpness Response Register

DNR REGISTERS 2 -0
(DNR 2 - DNR 0)
(Address (SR5-SR0) = 23H - 25H)
The Digital Noise Reduction Registers are three 8-bit wide register. They are used to control the DNR processing. See also page 26.

Coring Gain Border (DNR00-DNR03) :
These four bits are assigned to the gain factor applied to border areas .
In DNR Mode the range of gain values is 0 - 1, in increments of 1/8. This factor is applied to the DNR filter output which lies below the set threshold range. The result is then subtracted from the original signal.
In DNR Sharpness Mode the range of gain values is 0 - 0.5, in increments of 1/16. This factor is applied to the DNR filter output which lies above the threshold range. The result is added to the original signal.

Coring Gain Data (DNR04-DNR07) :
These four bits are assigned to the gain factor applied to the luma data inside the MPEG pixel block.
In DNR Mode the range of gain values is 0 - 1, in increments of 1/8. This factor is applied to the DNR filter output which lies below the set threshold range. The result is then subtracted from the original signal.
In DNR Sharpness Mode the range of gain values is 0 - 0.5, in increments of 1/16. This factor is applied to the DNR filter output which lies above the threshold range. The result is added to the original signal.
Figure 78, 79 show the various operations under the control of DNR Register 0.

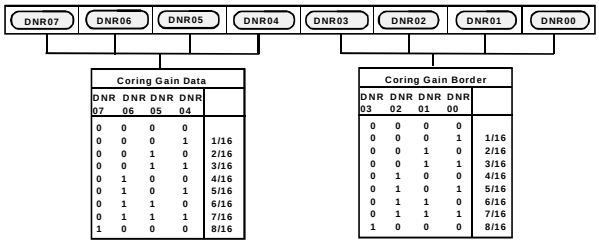

Figure 78. DNR Register 0 in DNR Sharpness Mode

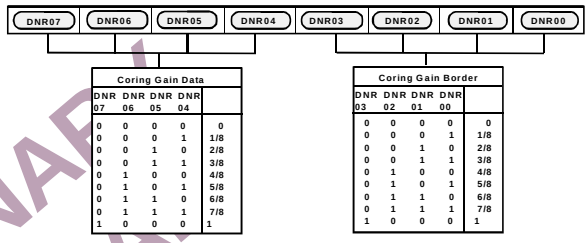

Figure 79. DNR Register1 in DNR Mode

DNR1 BIT DESCRIPTION-
DNR Threshold (DNR10 - DNR15):
These 6 bits are used to define the threshold value which is assigned a range from 0 to 63. The range is an absolute value. Special processing is done on the signal outside the threshold range to allow a smooth output signal.

Border Area (DNR16):
In setting DNR16 to a logic '1' the border transition area can be defined to consist of 4 pixels. If this bit is set to a logic '0' the border transition area consits of 2 pixels, where 1 pixel refers to 2 clock cycles at 27MHz.

Block size control (DNR17):
This bit is used to select the size of the data blocks to be processed. Setting the block size control function to a logic '1' defines a 16-pixel data block, a logic '0' defines an 8-pixel data block, where 1 pixel refers to 2 clock cycles at 27 MHz.

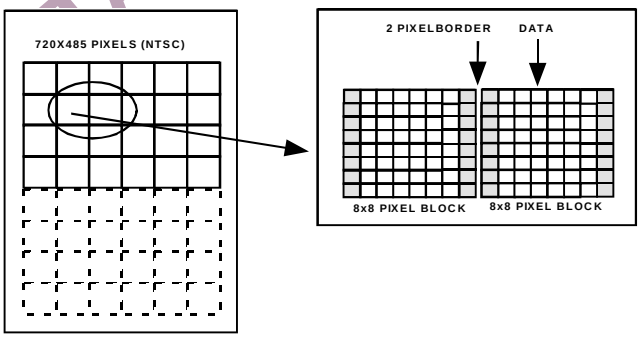

Figure 80. MPEG Block diagram

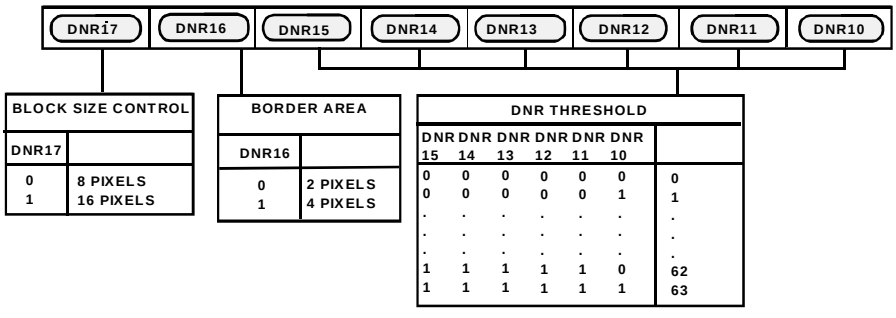

Figure 81. DNR Register 1

DNR2 BIT DESCRIPTION-

DNR Input Select (DNR20-DNR22):

Three bits are assigned to select the filtering which is applied to the incoming data (Y).The signal which lies in the passband of the selected filter is the signal which will be DNR processed. The figure below show the filter responses selectable with this control.

DNR Mode Control (DNR23):

This bit controls the DNR mode selected. A logic '0' selects DNR mode, a logic '1' selects DNR Sharpness mode.

DNR works on the principle of defining low amplitude, high frequency signals as probable noise and subtracting this noise from the original signal.

In DNR mode, it is possible to subtract a fraction of the signal which lies below the set threshold, assumed to be noise, from the original signal. The threshold is set in DNR Register 1.

When DNR Sharpness mode is enabled it is possible to add a fraction of the signal which lies above the set threshold to the original signal, since this data is assumed to be valid data and not noise. The overall effect being that the signal will be boosted (similar to using Extended SSAF filter) .

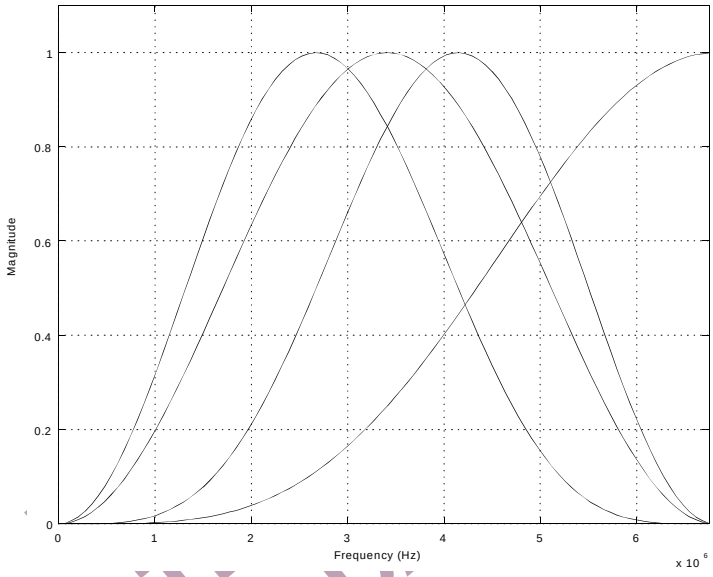

Figure 82. Filter Response of filters selectable in DNR 0

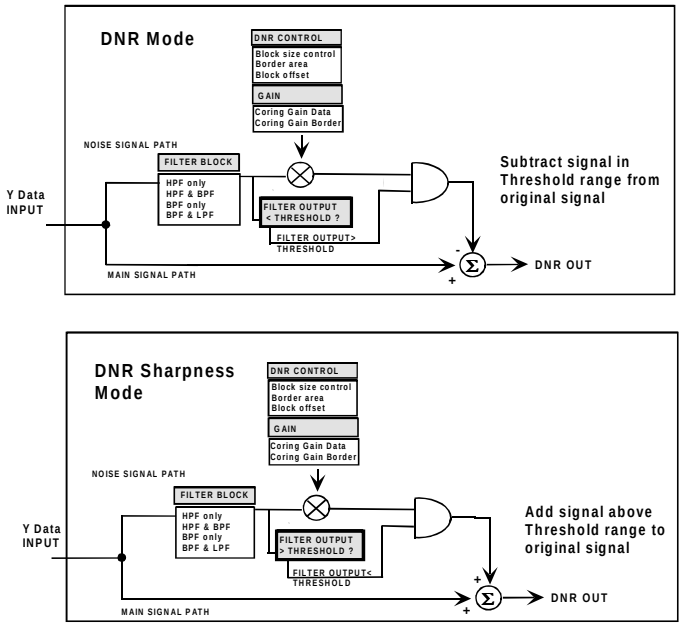

Figure 83 Block diagram for DNR mode and DNR Sharpness mode

Block Offset (DNR24- DNR27):
Four bits are assigned to this control which allows a shift of the data block of 16 pixels maximum. Consider the coring gain positions fixed. The block offset 'shifts' the data in steps of one pixel such that the border coring gain factors can be applied at the same position regardless of variations in input timing of the data.

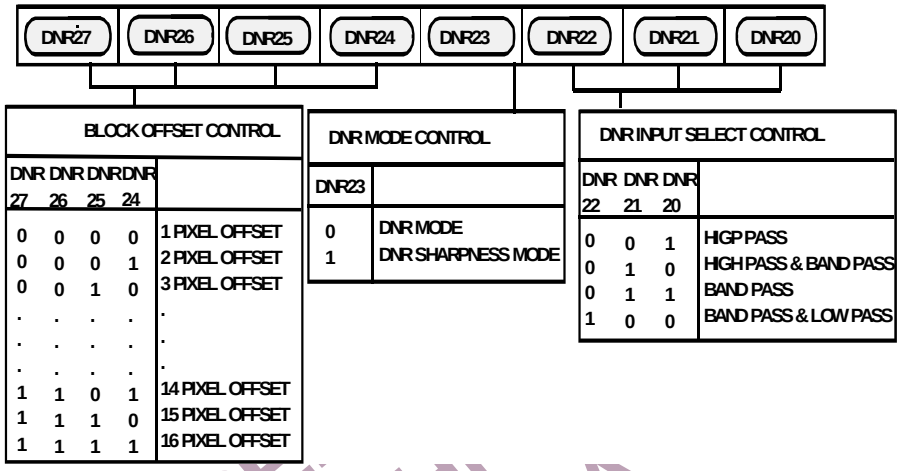

Figure 84 DNR Register 2

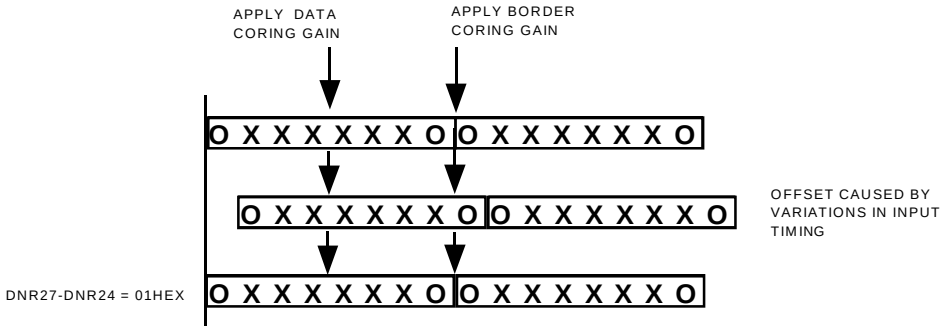

Figure 85 DNR 27-24, Block offset control

GAMMA CORRECTION REGISTERS 0-13 (GAMMA 0-13) (Address (SR5-SR0) = 26H -32H)

The Gamma Correction Registers are fourteen 8-bit wide register. They are used to program the gamma correction curves A and B.
Gamma correction is applied to compensate for the non linear relationship between signal input and brightness level output (as perceived on the CRT) . It can be applied wherever non linear proceessing is used.

Gamma correction uses the function:

$$\text{Signal}_{OUT} = (\text{Signal}_{IN})^{\gamma}$$

where γ = gamma power factor

Gamma correction is performed on the luma data only. The user has the choice to use two different curves, curve A or curve B. At any one time only one of these curves can be used.
The response of the curve is programmed at 7 predefined locations. In changing the values at these locations the gamma curve can be modified. Between these points linear interpolation is used to generate intermediate values. Considering the curve to have a total length of 256 points, the seven locations are at:

32, 64, 96, 128, 160, 192, 224.

Values at location 0, 16, 240 and 255 are fixed and can not be changed.

For the length of 16 to 240 the gamma correction curve has to be calculated as below:

$$y = x^{\gamma}$$

where y = gamma corrected output
x = linear input signal
γ = gamma power factor

To program the gamma correction registers, the 7 values for y have to be calculated using the following formulare:

$$y_n = [\, x_{(n-16)} / (240 - 16)\,]^{\gamma} \times (240-16) + 16$$

where $x_{(n-16)}$ = Value for x along x-axis
y_n = Value for y along the y-axis, which has to be written into the gamma correction register.
n = 32, 64, 96, 128, 160, 192 or 224

EXAMPLE

$y_{32} = [\,(16 / 224)^{0.5} \times 224] + 16 = 76^{\star}$
$y_{64} = [\,(48 / 224)^{0.5} \times 224] + 16 = 120^{\star}$
$y_{96} = [\,(80 / 224)^{0.5} \times 224] + 16 = 150^{\star}$
$y_{128} = [\,(112 / 224)^{0.5} \times 224] + 16 = 174^{\star}$
* rounded to the nearest integer

The above will result in a gamma curve shown below, assuming a ramp signal as an input.

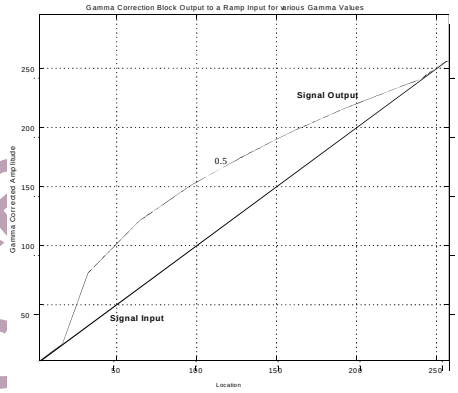

Figure 86 Signal Input (Ramp) and Signal Output for Gamma 0.5

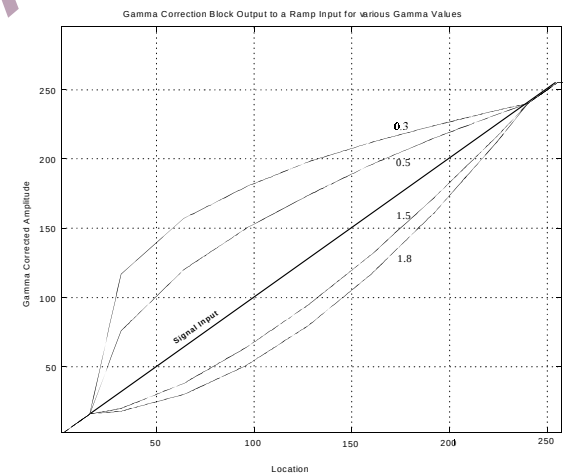

Figure 87 Signal Input (Ramp) and selectable Gamma Output curves

The gamma curves shown above are examples only, any user defined curve is acceptable in the range of 16-**240.**

BRIGHTNESS DETECT REGISTER
(Address (SR5-SR0) = 34H)
The Brightness Detect Register is a 8-bit wide register used only to read back data in order to monitor the brightness/darkness of the incoming video data on a field-by-field basis. The brightness information is read from the I2C and based on this information, the color controls or the gamma correction controls may be adjusted.

The luma data is monitored in the active video area only. The average brightness I2C register is updated on the fallling edge of every VSYNC signal.

OUTPUT CLOCK REGISTER
OCR 9-0
(Address (SR4-SR0) = 35H)
The Output Clock Register is a 8-Bit wide register. Figure 88 shows the various operations under the control of this register.

OCR BIT DESCRIPTION
Reserved (OCR00):
A logic '0' must be written to this bit.

CLKOUT pin Control (OCR01):
This bit enables the CLKOUT pin when set to '1' and therefore outputs a 54MHz clock generated by the internal PLL. The PLL and 4xOversampling have to be enabled for this control to take effect, (MR61, ' 0' ; MR16 = '1').

Reserved (OCR02):
A logic '0' must be written to this bit.

Reserved (OCR03-06):
A logic '1' must be written to these bits.

Reserved (OCR07):
A logic '0' must be written to this bit.

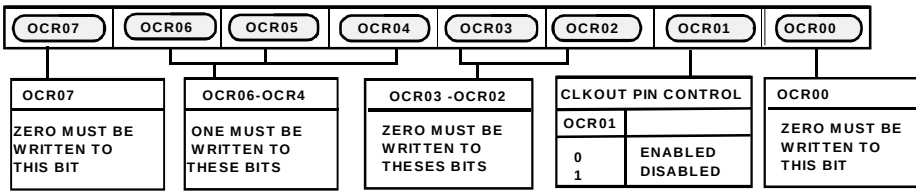

Figure 88. Output Clock Register (OCR)

APPENDIX 1

BOARD DESIGN AND LAYOUT CONSIDERATIONS

The ADV7190 is a highly integrated circuit containing both precision analog and high speed digital circuitry. It has been designed to minimize interference effects on the integrity of the analog circuitry by the high speed digital circuitry. It is imperative that these same design and layout techniques be applied to the system level design such that high speed, accurate performance is achieved. The "Recommended Analog Circuit Layout" shows the analog interface between the device and monitor.

The layout should be optimized for lowest noise on the ADV7190 power and ground lines by shielding the digital inputs and providing good decoupling. The lead length between groups of V_{AA} and GND pins should by minimized so as to minimize inductive ringing.

Ground Planes

The ground plane should encompass all ADV7190 ground pins, voltage reference circuitry, power supply bypass circuitry for the ADV7190, the analog output traces, and all the digital signal traces leading up to the ADV7190. The ground plane is the board's common ground plane.
This should be as substantial as possible to maximize heat spreading and power dissipation on the board.

Power Planes

The ADV7190 and any associated analog circuitry should have its own power plane, referred to as the analog power plane (V_{AA}). This power plane should be connected to the regular PCB power plane (V_{CC}) at a single point through a ferrite bead. This bead should be located within three inches of the ADV7190.
The metallization gap separating device power plane and board power plane should be as narrow as possible to minimise the obstruction to the flow of heat from the device into the general board.

The PCB power plane should provide power to all digital logic on the PC board, and the analog power plane should provide power to all ADV7190 power pins and voltage reference circuitry.

Plane-to-plane noise coupling can be reduced by ensuring that portions of the regular PCB power and ground planes do not overlay portions of the analog power plane, unless they can be arranged such that the plane-to-plane noise is common-mode.

Supply Decoupling

For optimum performance, bypass capacitors should be installed using the shortest leads possible, consistent with reliable operation, to reduce the lead inductance. Best performance is obtained with 0.1 µF ceramic capacitor decoupling. Each group of V_{AA} pins on the ADV7190 must have at least one 0.1 µF decoupling capacitor to GND. These capacitors should be placed as close as possible to the device.

It is important to note that while the ADV7190 contains circuitry to reject power supply noise, this rejection decreases with frequency. If a high frequency switching power supply is used, the designer should pay close attention to reducing power supply noise and consider using a three- terminal voltage regulator for supplying power to the analog power plane.

Digital Signal Interconnect

The digital inputs to the ADV7190 should be isolated as much as possible from the analog outputs and other analog circuitry. Also, these input signals should not overlay the analog power plane.

Due to the high clock rates involved, long clock lines to the ADV7190 should be avoided to reduce noise pickup.
Any active termination resistors for the digital inputs should be connected to the regular PCB power plane (V_{CC}), and not the analog power plane.

Analog Signal Interconnect

The ADV7190 should be located as close as possible to the output connectors to minimize noise pickup and reflections due to impedance mismatch.

The video output signals should overlay the ground plane, and not the analog power plane, to maximize the high frequency power supply rejection.

Digital inputs, especially pixel data inputs and clocking signals should never overlay any of the analog signal circuitry and should be kept as far away as possible.

For best performance, the outputs should each have a 300ohm load resistor connected to GND. These resistors should be placed as close as possible to the ADV7190 so as to minimize reflections.

The ADV7190 should have no inputs left floating. Any inputs that are not required should be tied to ground.

APPENDIX 1

BOARD LAYOUT

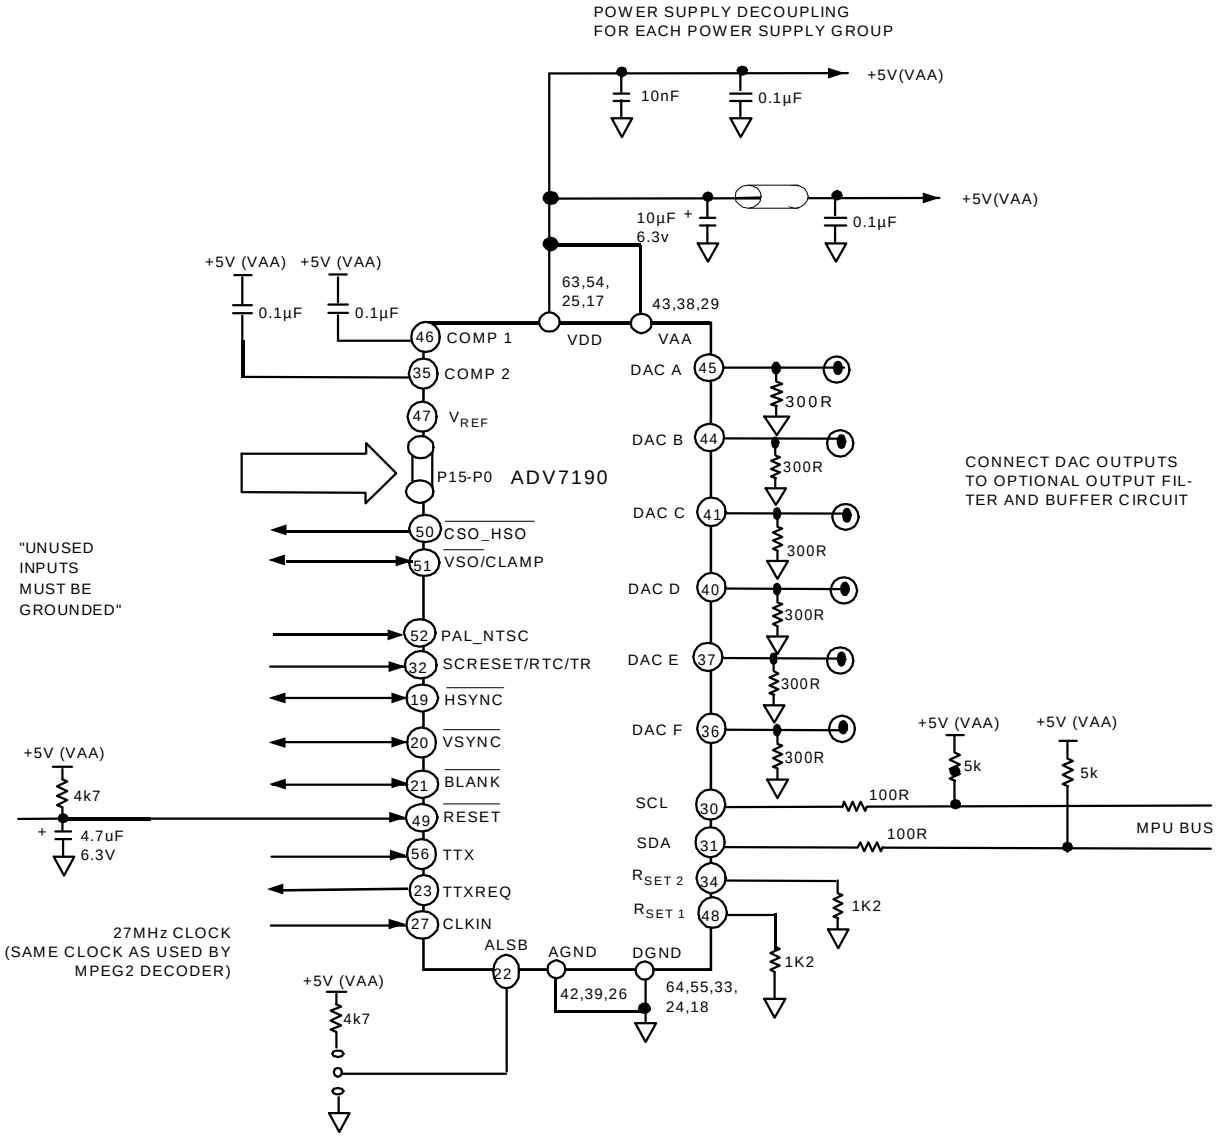

Figure 89. Recommended Anlaog Circuit Layout

APPENDIX 2

CLOSED CAPTIONING

The ADV7190 supports closed captioning conforming to the standard television synchronizing waveform for color transmission. Closed captioning is transmitted during the blanked active line time of Line 21 of the odd fields and Line 284 of even fields.

Closed captioning consists of a 7-cycle sinusoidal burst that is frequency and phase locked to the caption data. After the clock run-in signal, the blanking level is held for two data bits and is followed by a logic level "1" start bit. 16 bits of data follow the start bit. These consist of two 8-bit bytes, seven data bits and one odd parity bit. The data for these bytes is stored in Closed Captioning Data Registers 0 and 1.

The ADV7190 also supports the extended closed captioning operation which is active during even fields and is encoded on Scan Line 284. The data for this operation is stored in Closed Captioning Extended Data Registers 0 and 1.

All clock run-in signals and timing to support Closed Captioning on Lines 21 and 284 are generated automatically by the ADV7190. All pixels inputs are ignored during Lines 21 and 284 if closed captioning is enabled.

FCC Code of Federal Regulations (CFR) 47 section 15.119 and EIA608 describe the closed captioning information for Lines 21 and 284.

The ADV7190 uses a single buffering method. This means that the closed captioning buffer is only one byte deep, therefore there will be no frame delay in outputting the closed captioning data unlike other two byte deep buffering systems. The data must be loaded one line before (Line 20 or Line 283) it is outputted on Line 21 and Line 284. A typical implementation of this method is to use $\overline{\text{VSYNC}}$ to interrupt a microprocessor, which in turn will load the new data (two bytes) every field. If no new data is required for transmission, "0"es must be inserted in both data registers, this is called NULLING. It is also important to load 'control codes' all of which are double bytes on Line 21 or a TV will not recognize them. If there is a message like "Hello World" which has an odd number of characters, it is important to pad it out to even in order to get "end of caption" 2-byte control code to land in the same field.

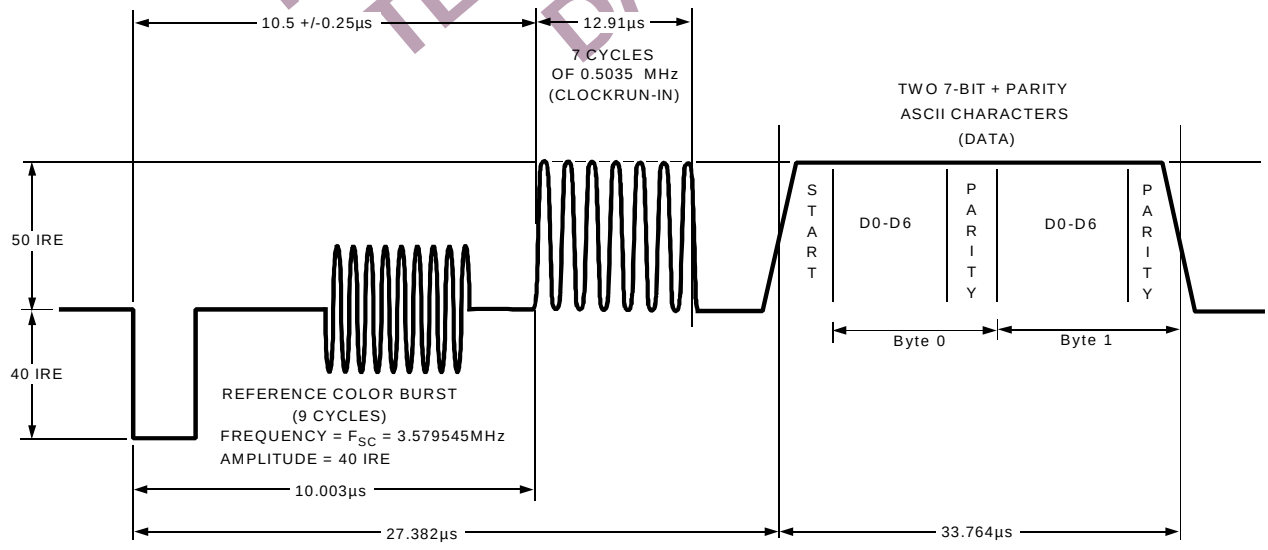

Figure 90. Closed Captioning Waveform (NTSC)

APPENDIX 3

COPY GENERATION MANAGEMENT SYSTEM (CGMS)

The ADV7190 supports Copy Generation Management System (CGMS) conforming to the standard. CGMS data is transmitted on Line 20 of the odd fields and Line 283 of even fields. Bits C/W05 and C/W06 control whether or not CGMS data is outputed on ODD and EVEN fields. CGMS data can only be transmitted when the ADV7190 is configured in NTSC mode. The CGMS data is 20 bits long, the function of each of these bits is as shown below. The CGMS data is preceeded by a reference pulse of the same amplitude and duration as a CGMS bit, see figure below. These bits are outputed from the configuration registers in the following order: C/W00 = C16, C/W01= C17, C/W02 = C18, C/W03 = C19, C/W10 = C8 , C/W11 = C9, C/W12 = C10, C/W13 = C11, C/W14 = C12, C/W15 = C13, C/W16 = C14 , C/W17 = C15 , C/W20 = C0 , C/W21 = C1, C/W22 = C2, C/W23 = C3, C/W24 = C4, C/W25 = C5, C/W26 = C6, C/W27= C7. If the bit C/W04 is set to a logic "1", the last six bits C19-C14 which comprise the 6-bit CRC check sequence are calculated automatically on the ADV7190 based on the lower 14 bits (C0-C13) of the data in the data registers and output with the remaining 14-bits to form the complete 20-bits of the CGMS data. The calculation of the CRC sequence is based on the polynomial $X^6 + X + 1$ with a preset value of 111111. If C/W04 is set to a logic "0" then all 20-bits (C0-C19) are output directly from the CGMS registers (no CRC calculated, must be calculated by the user).

Function of CGMS bits:

WORD 0 - 6 BITS
WORD 1 - 4 BITS
WORD 2 - 6 BITS
CRC - 6 BITS CRC polynomial = $X^6 + X + 1$ (preset to 111111)

WORD 0		1	0

APPENDIX 4

WIDE SCREEN SIGNALLING

The ADV7190 supports Wide Screen Signalling (WSS) conforming to the standard. WSS data is transmitted on line 23. WSS data can only be transmitted when the ADV7190 is configured in PAL mode. The WSS data is 14-bits long, the function of each of these bits is as shown below. The WSS data is preceeded by a run-in sequence and a Start Code, see figure below. The bits are output from the configuration registers in the following order: C/W20 = W0, C/W21= W1, C/W22 = W2, C/W23 = W3, C/W24 = W4 , C/W25 = W5, C/W26 = W6, C/W27 = W7, C/W10 = W8, C/W11 = W9, C/W12 = W10 , C/W13 = W11 , C/W14 = W12 , C/W15 = W13 . If the bit C/W07 is set to a logic "1" it enables the WSS data to be transmitted on Line 23. The latter portion of Line 23 (42.5µs from the falling edge of $\overline{\text{HSYNC}}$) is available for the insertion of video.

Function of CGMS bits:

Bit 0 - Bit 2 Aspect Ratio / Format / Position
Bit 3 is odd parity check of Bit 0 -Bit 2

B0, B1, B2,B3	Aspect Ratio	Format	Position
0 0 0 1	4:3	Full Format	non-applicable
1 0 0 0	14:9	Letterbox	centre
0 1 0 0	14:9	Letterbox	top
1 1 0 1	16:9	Letterbox	centre
0 0 1 0	16:9	Letterbox	top
1 0 1 1	>16:9	Letterbox	centre
0 1 1 1	14:9	Full Format	centre
1 1 1 0	16:9	non-applicable	non-applicable

APPENDIX 5

Teletext Insertion

Time T_{pd} is the time needed by the ADV7190 to interpolate input data on TTX and insert it onto the CVBS or Y outputs, such that it appears $T_{synTxtOut}$ = 10.2µs after the leading edge of the horizontal signal. Time Txt_{Del} is the pipeline delay time by the source that is gated by the TTREQ signal in order to deliver TTX data.
With the programability that is offered with TTXREQ signal on the Rising/Falling edges, the TTX data is always inserted at the correct position of 10.2µs after the leading edge of Horizontal Sync pulse, thus this enables a source interface with variable pipeline delays.
The width of the TTXREQ signal must always be maintained such that it allows the insertion of 360 (in order to comply with the Teletext Standard "PAL-WST") teletext bits at a text data rate of 6.9375Mbits/s, this is achieved by setting TC03-TC00 to "0". The insertion window is not open if the Teletext Enable bit (MR34) is set to "0".

Teletext Protocol

The relationship between the TTX bit clock (6.9375MHz) and the system CLOCK (27MHz) for 50Hz is given as follows:

(27Mhz / 4) = 6.75MHz
(6.9375 X 10^6 / 6.75 X 10^6 = 1.027777

Thus 37 TTX bits correspond to 144 clocks (27MHz), each bit has a width of almost 4 clock cycles. The ADV7190 uses an internal sequencer and variable phase interpolation filter to minimize the phase jitter and thus generate a bandlimited signal which can be output on the CVBS and Y outputs.

At the TTX input the bit duration scheme repeats after every 37 TTX bits or 144 clock cycles. The protocol requires that TTX Bits 10, 19, 28, 37 are carried by three clock cycles, all other bits by four clock cycles. After 37 TTX bits, the next bits with three clock cycles are Bits 47, 56, 65 and 74. This scheme holds for all following cycles of 37 TTX bits, until all 360 TTX bits are completed. All teletext lines are implemented in the same way. Individual control of teletext lines are controlled by Teletext Setup Registers.

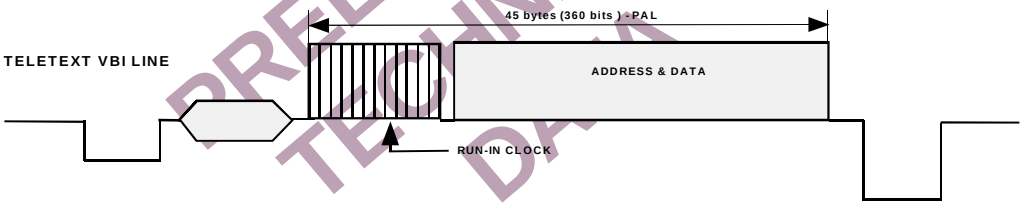

Figure 93 Teletext VBI Line

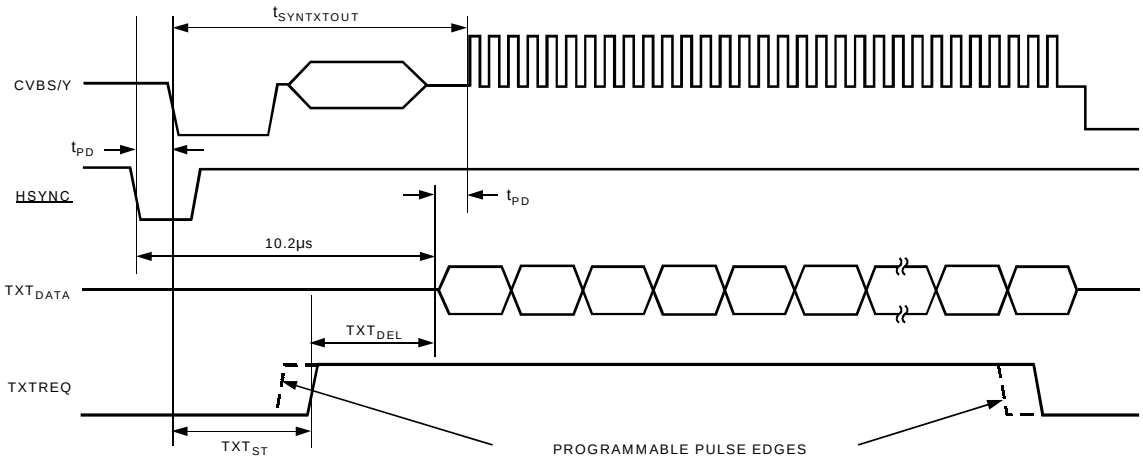

$t_{SYNTXTOUT}$ = 10.2µs
t_{PD} = PIPELINE DELAY THROUGH ADV7190
TXT_{DEL} = TTXREQ TO TTX (PROGRAMMABLE RANGE = 4 BITS [0-15 CLOCK CYCLES])

Figure 94. Teletext Functionality Diagram

APPENDIX6

OPTIONAL Output Filter

If an output filter is required for the CVBS, YUV, Chroma and RGB outputs of the ADV7190, the filter in Figure 95 can be used in 2xOversampling Mode, Figure 96 shows a filter which can be used in 4XOversampling Mode. The plot of the filter characteristics are shown in Figure 97-98. An output filter is not required if the outputs of the ADV7190 are connected to most analog monitors or TVs, however if the output signals are applied to a system where sampling is used (eg. Digital TVs) then a filter is required to prevent aliasing.

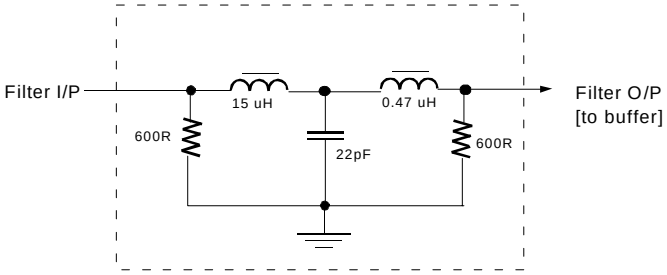

Figure 95. Output Filter for 2xOversampling Mode

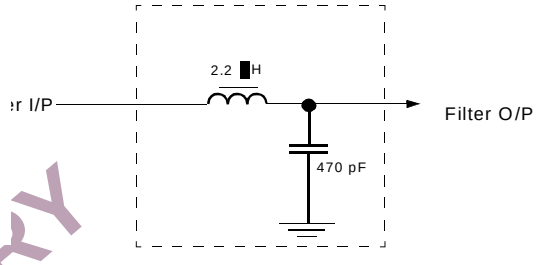

Figure 96. Output Filter for 4xOversampling Mode

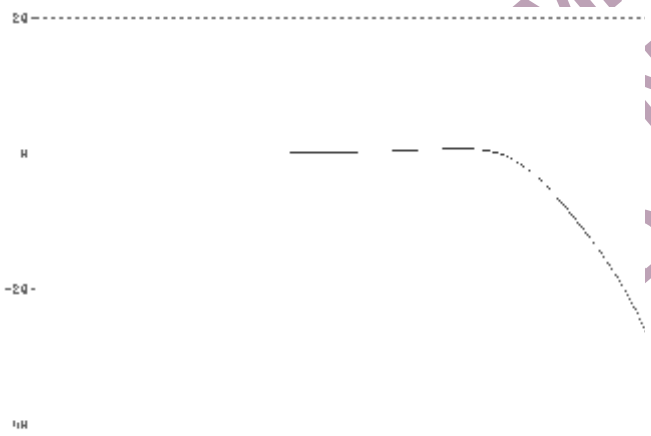

Figure 97. Output Filter Plot for2xOversampling filter

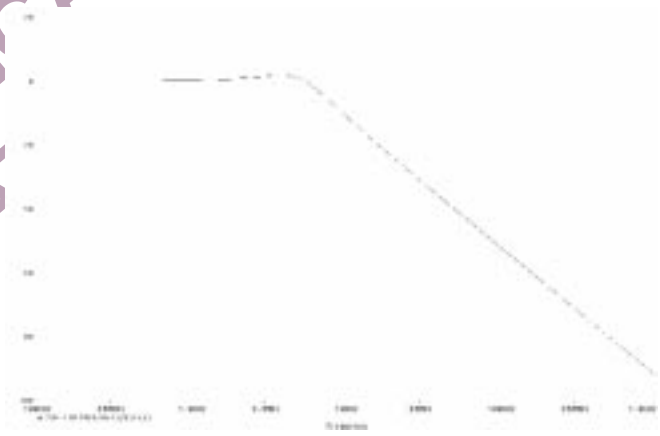

Figure 98. Output Filter Plot for 4xOversampling filter

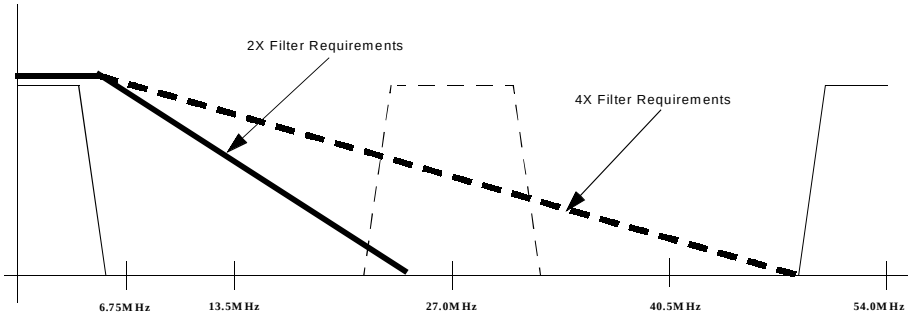

Figure 99. Output Filter Requirements in 4xOversampling Mode

APPENDIX7

DAC Buffering

External buffering is needed on all of the ADV7190 DAC outputs. The configuration in Figure 101 is recommended. .

When calculating absolute output full scale current and voltage use the following equations:

$V_{OUT} = I_{OUT} * R_{LOAD}$

$I_{OUT} = (V_{REF} * K)/ R_{SET}$ K= 4.2146 constant, V_{REF} = 1.235V

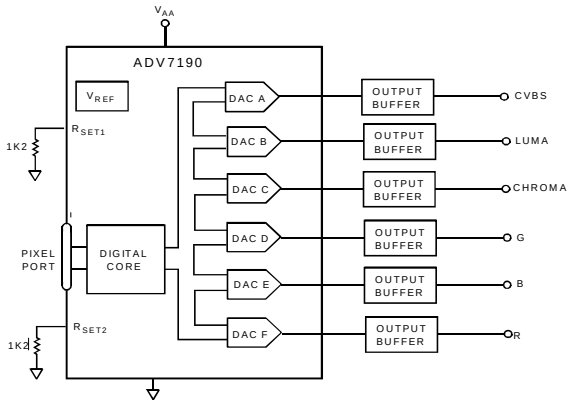

Figure 100. Output DAC Buffering Configuration

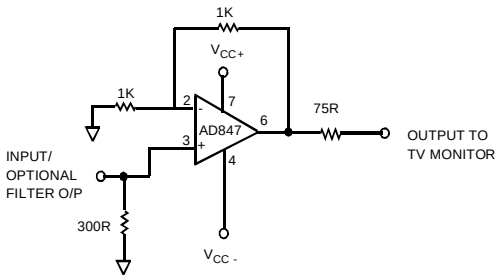

Note: Alternatively the AD8051 Op-amp can be used.

Figure 101. Recommended DAC Output Buffer using an OP-amp

APPENDIX 8
RECOMMENDED Register Values

The ADV7190 registers can be set depending on the user standard required.
The following examples give the various register formats for several video standards.
